The Directorate of Environment and Climate Change (DoECC) is a wing of the Department of Environment, Government of Kerala. DoECC is the nodal agency in the administrative structure of the Environment Department, for the planning, coordination and overseeing of the implementation of the Environment and Climate Change policies and programmes of the Central and State Governments. DoECC coordinates all the Climate Change Actions and programmes in the State.

GOVERNMENT OF KERALA

Suneel Pamidi IFS

Director, Directorate of Environment and Climate Change

Kerala has consistently been at the forefront of addressing climate change through proactive and forward-looking initiatives. As one of the first states to revise and develop SAPCC 2.0, Kerala has demonstrated its commitment to responding effectively to evolving challenges of climate change. The Hon'ble Chief Minister of Kerala's announcement of the Carbon Neutral 2050 target further underscores the State's leadership, and the State is taking rapid strides in mitigating emissions and scaling up climate initiatives.

In this direction, a robust and up-to-date greenhouse gas (GHG) inventory forms the cornerstone for informed decision-making. Kerala's comprehensive GHG inventory for the period from 2005 to 2021 was launched by the Hon'ble Chief Minister in June 2024. Building on this work, the present document provides an updated and extended inventory, incorporating the latest available datasets and expanding emissions estimates up to 2023. This revision strengthens both the temporal relevance and analytical depth of the inventory, enabling improved tracking of emission trends and sectoral contributions.

Alongside the extension of the time series, selected emission categories within the inventory have been revised using newly available data, and a few new categories have also been included in the latest estimates, thereby making the emissions more robust. For instance, estimates of forest carbon removals have been updated in line with the latest findings of the India State of Forest Report 2023, resulting in a more accurate representation of the State's sequestration potential. Accordingly, the total greenhouse gas emissions of Kerala for the year 2023 are estimated at 25.60 MtCO₂e (Gross Emission) and 10.99 MtCO₂e (Net Emission).

As we advance toward our 2050 target, a critical next step will be the integration of GHG accounting into the internal frameworks of individual departments for quick feedback and mainstreaming climate data into all sectors of governance.

The Directorate of Environment and Climate Change, Government of Kerala, as the nodal department responsible for implementing SAPCC 2.0 and the Government's Carbon Neutral Initiative, has continued its partnership with the Vasudha Foundation to periodically update and strengthen the GHG inventory, including the extended emissions estimates, which have been updated on the Kerala GHG Portal, in line with evolving data and methodological advancements. This revised edition reflects that ongoing commitment to improving the accuracy, completeness, and relevance of Kerala's emissions profile. I extend my sincere appreciation to all the authors and experts who contributed to this updated scientific document, which will serve as a vital resource for all stakeholders engaged in advancing climate action in Kerala.

Executive Summary

This report compiles an inventory of anthropogenic Greenhouse Gas (GHG) emissions in Kerala, estimated as a priority policy aid and a baseline for climate change mitigation actions. The report is part of the implementation blueprint for the State Action Plan on Climate Change (SAPCC 2.0), commissioned by the State in 2022. Even though the GHG emission from the State may not own a major share in the cumulative warming phenomena at the national or global levels, the identification of the various sources of GHG emission and their quantification would aid the State in engaging in the NDC¹ commitments at the national level and to device its emission pathways.

It has been unequivocally established that the earth is warming at an increased rate and that being caused by anthropogenic GHGs². On the global scale, 2023 was the planet's warmest year on record³. On regional scales the Kerala SAPCC 2.0 projects a *warming scenario* in the State (RCP 4.5 and RCP 8.5) for the near term (2021- 2050). GHGs absorb infrared radiation, trapping heat in the atmosphere and making the planet warmer. The most important greenhouse gases directly emitted by human activity include

carbon dioxide (CO₂), methane (CH₄), nitrous oxide (N₂O), and several fluorine- containing halogenated substances (e.g. HFCs, PFCs, SF₆ and NF₃). Although CO₂, CH₄, and N₂O occur naturally in the atmosphere, human activities have evidently changed their atmospheric concentrations. Global net anthropogenic GHG emissions have been estimated to be 59 ± 6.6 GtCO₂e in 2019, about 12% (6.5 GtCO₂e) higher than in 2010 and 54% (21 GtCO₂e) higher than in 1990, with the largest share and growth in gross GHG emissions occurring in CO₂ from fossil fuels combustion and industrial processes followed by CH₄ (IPCC, 2023).

The assessments presented here have significant near-term and long-term policy leads to highlight. Kerala has been a highly urbanized society with almost half of the population (75%) living in urban centers (Census Population Projection, 2019). The population density of Kerala is the highest in the nation (860/km²) and is estimated to have reached 920.6/km² if the latest population projections are considered⁴. With these demographic features, urban planning and management have gained increased significance. This assessment identifies the Waste sector as the second largest emitter of GHG in the State. Domestic wastewater along with solid waste is identified to be the main source of emissions in the sector. Waste treatment essentially demands innovative approaches to reduce emissions from these sources.

¹ NDCs are climate actions that each country had communicated to the United Nations Framework Convention on Climate Change (UNFCCC), that are aligned to achieve the Long-term goals of the Paris Agreement—i.e., limiting global average temperature well below 2 °C compared to the pre-industrial period. India also announced the following NDC targets: i) increasing the fossil free electric power installed-capacity share to 40%, ii) reducing the emissions intensity of GDP by 33%–35% (from 2005 levels), and iii) adding 2.5 to 3 billion tonnes of carbon sink by the year 2030³

² IPCC AR-6

³ State of Climate Report 2023, WMO

⁴ Based on Population Projections for India and States 2011-2036 (Census)

Key insights:

- The GHG emission inventory from 2005 to 2023 covers five main sectors, Energy, IPPU (Industrial Processes and Product Use), Agriculture, LULUCF (Land Use, Land-Use Change and Forestry) and Waste. It includes all relevant sub-sectors and categories, capturing emissions of CO₂, CH₄, and N₂O for a comprehensive year-on-year assessment.
- In 2023, Kerala's gross emissions (excluding LULUCF) were 25.60 Million tonnes Carbon dioxide equivalent (MtCO₂e), marking an 8.6% increase from the 2005 level of 23.60 MtCO₂e, while the Net emissions (including LULUCF, i.e. adjusting emissions with sinks) increased from 10.05 MtCO₂e in 2005 to 10.99 MtCO₂e in 2023.
- The key categories contributing to Kerala's gross emissions were Transport, Residential Energy, Industrial Energy, and Domestic Wastewater, together accounting for 80.17%, in 2023.
- Energy sector emerged as the largest source of emissions in the State, during the reference period emitting 20.64 MtCO₂e which accounted for ~81% of the State's total Gross GHG emissions in 2023. Transport led the sector with ~66%, followed by residential and industrial energy use.
- The Waste sector was the second largest emitter in Kerala contributing 1.92 MtCO₂e in 2023 and accounting for ~7% of the Gross GHG emissions. In 2023, Domestic Wastewater accounted for 96.14 % of the waste sector emissions, followed by Industrial Wastewater at 2.16% and Municipal Solid Waste at 1.70%.
- The Agriculture sector was the third-largest emitter in Kerala, contributing 1.57 MtCO₂e in 2023, accounting for approximately 6% of the State's Gross GHG emissions (excluding LULUCF). The livestock sub sector was the primary contributor to agricultural emissions accounting for ~70% on average throughout the reference period.
- The IPPU sector contributed to 1.47 MtCO₂e emissions in 2023 accounting for ~6% of the Gross GHG Emissions (excluding LULUCF). Chemical industry alone emitted 1.20 MtCO₂e, in 2023 accounting for 82% of the total IPPU sector emissions
- LULUCF remained a net carbon sink, sequestering an average of 15.59 MtCO₂e throughout the reference period. In 2023, it offset 57% of Kerala's gross emissions (excluding LULUCF).

Agriculture has emerged to be the third largest emitting sector in the order of emissions. However, its contribution is at least twelve times less than the lead emitting sector throughout the reference period and is showing a decline at an average rate of 1.2%. This has to be seen consistent with the fact that, from 2002-03 levels, the net cropped area in Kerala has declined ~7% and this decline is steady across the long term. Moreover, the wetland paddy area alone has recorded a decline of 39.84% during the period (GoK, 2023a). Thus, emissions from the Agriculture sector are mainly associated with livestock emissions rather than the mainline agricultural practices.

Kerala has a relatively developing industrial base, and industrial emissions are the fourth largest contributor to GHG emissions in the State. This may have certain data limitations regarding the present assessment; however, the State needs modern approaches to bring in emission-containing industrial processes, especially in the chemical and mineral industries to decarbonize the sector. This can be a possible enhancement in the Kerala Industrial and Commercial Policy. Fostering measures to improve energy efficiency or to reduce emission intensity of industries at the State level has to be brought under proper policy and standards framework. In fact, SAPCC 2.0 envisages improving the energy efficiency of

Non-PAT (Perform Achieve and Trade) industries and micro, small and medium enterprises as a major mitigation strategy for 2023-2030.

The most striking part of this inventory is the quintessential results from the LULUCF and the Energy Sectors. These outcomes have implications for specific policies and near-term strategies in climate change intervention and sustainable lifestyles in the State. Kerala is a State with 29.66%⁵ of forest area and a forest cover of 56.78%^{6,7}. This essentially has resulted in a large carbon sink in the State. The legal forest area of Kerala has remained largely undisturbed for the last few decades and the forest cover which includes tree cover outside the legal forest area has increased as per the India State of Forest Report (ISFR, 2023). Even with the above sink, Kerala has emerged to be a net emitter mainly due to the contributions from the Energy sector. The Energy sector is identified as the lead emitting sector in the State. Within the Energy Sector, the transport sub-sector is the prime contributor, accounting for 53% of the State's gross emissions, of which 87% is from road transport category. The SAPCC 2.0 estimates Kerala to have ~2 Crore two-wheelers, ~6 Lakh rickshaws, ~1 Crore cars, and 1.5 Lakh buses by 2030⁸. With these growth projections, innovative transport solutions are inevitable to decarbonize the sector on a priority basis.

The Fourteenth Five Year Plan of the State envisages improving the efficiency of public transportation by modernizing the fleet with energy-efficient buses including e-buses and

innovative mass rapid transit systems like the integrated transport system in Kochi which link the metro rail and water metro networks. A modest way forward for the State may be to explore and use its plentiful inland waterways more intensively and introduce more solar-powered vessels that could lessen the load from the emission-intensive road transport.

Based on the mitigation potential assessment of the State, the mitigation strategies envisaged in the SAPCC 2.0 aim at a reduction of ~57000 ktCO₂ in 2030. Moreover, there are various policy interventions existing in the State that can be aligned with such target strategies to leverage the collective momentum. The Carbon Neutral Kerala 2050 initiative envisages net zero emissions by 2050; the Eco Restoration Policy 2021 envisages the restoration of monoculture plantations inside forests. Mission LiFE envisages an environmentally conscious lifestyle at the national level. The Electric Vehicle Policy Kerala 2019 envisages electric mobility as a tool to promote shared mobility and clean transportation to ensure environment sustainability. The Energy Conservation (Building Code) Rules 2017 defines norms of energy performance for various building components and takes into consideration the climatic region. This report is expected to establish a fundamental link with all such endeavours in the State towards the 2050 target. Further to this assessment, the pathways for carbon neutrality shall be prepared to supplement the findings.

5 Administrative Report Kerala Forests & Wildlife Department 2022

6 SFR 2023

7 The term 'Forest Area' (or recorded forest area) generally refers to all the geographic areas recorded as forests in government records. On the other hand, the term 'Forest Cover' refers to all lands more than one hectare in area, having a tree canopy density of more than 10%.(FSI,2023)

8 Assessment Based on data available with VAHAN and existing vehicle growth trends (SAPCC 2.0),

2

SAPCC 2.0 Implementation

SAPCC 2.0 is the master plan for climate change adaptation and mitigation actions in the State. The plan was approved by the State and the MoEFCC and lists the major adaptation and mitigation actions to be undertaken for the period 2023-2030. Specific outcomes, objectives, and actions for attaining climate resilience in the State have been listed in the plan. Under Priority Interventions envisaged, Outcome 6 proposes to establish a Statewide Climate Database System. The objective is to establish an effective climate change monitoring mechanism. Action-4 under this objective, proposes a GHG emission monitoring mechanism for the State.

Concurrently, to achieve the State's carbon neutral target by 2050, the State government

has constituted a Working Group as per G.O (Rt) No. 81/2021/Env't dated 10.11.2021, with the Additional Chief Secretary, Environment as the Chairperson and entrusted the Directorate of Environment and Climate Change (DoECC) to draw up an action plan. In this context, the DoECC has signed a Memorandum of Understanding with Vasudha Foundation, an independent not-for-profit policy research institution working in the areas of climate policy and clean energy, in developing a detailed greenhouse gas inventory of the State and formulate framework/pathways to achieve carbon neutrality by 2050, through active participation of all the stakeholders.

3

Approach and Methodology

An exhaustive approach involving multiple levels of stakeholder consultations, review of technical documents, data sets and guidelines have been followed to arrive at the estimates in this report. The inventory network comprises a technical core team of 15 sector-based experts and professionals from the Directorate of Environment and Climate Change and Vasudha Foundation and a statewide technical team of 109 technical officers and academics from 76 stakeholder departments, agencies, and universities, guiding the processes through two State-level core group deliberations and multiple consultation sessions across 24 months. Identification and consolidation of State-specific activities, activity data and elimination of anomalies have been ensured through the consultative process.

The assessments for the inventory have rigorously followed the latest IPCC methodology and guidelines (IPCC, 2006; IPCC, 2019) covering

Box 1.1. Carbon Dioxide Equivalent (CO₂e)

A carbon dioxide equivalent or CO₂e, is a metric measure used to compare the emissions from various greenhouse gases based on their Global-Warming Potential (GWP), by converting amounts of other gases to the equivalent amount of carbon dioxide with the same Global Warming Potential.

four sectors, namely, Energy, IPPU (Industrial Processes and Product Use), AFOLU (Agriculture, Forestry & Other Land Use) and Waste. However, for reporting AFOLU has been bifurcated to the Agriculture and LULUCF sectors in alignment with the Government of India's GHG inventory reports. Moreover, this inventory covers all relevant sub-sectors and categories that contribute to the GHG emissions accounting for CO₂, CH₄ and N₂O emissions.

Box 1.2. Global Warming Potential (GWP)

The IPCC developed the Global Warming Potential (GWP) concept to compare the ability of a greenhouse gas to trap heat in the atmosphere relative to another gas. The GWP of a greenhouse gas is defined as the ratio of the accumulated radiative forcing within a specific time horizon caused by emitting 1 kilogram of the gas, relative to that of the reference gas CO₂ (IPCC 2013). CO₂-equivalent emissions are provided in million tonnes of CO₂ equivalent (MtCO₂e). 100-year GWP values from the IPCC Second Assessment Report (AR2) has been used in this report for calculating CO₂-equivalents to align with the National Communications of India to the UNFCCC. A comparison of emission values with the 100-year GWP values from the IPCC Sixth Assessment Report (AR6) (IPCC 2021) can be found in the Climate Change Portal of DoECC. The 100-year GWP values used in this report are listed in *Appendix-2*.

The estimations are largely based on IPCC's Tier 1 and Tier 2 methods of emissions estimation (see Box 1.1). The emission factors assumed for various categories of emissions are by and large taken from the Government of India's inventory submissions to the United Nations Framework Convention on Climate Change (UNFCCC)⁹. The Tier 1 (T1) or IPCC-suggested standard approach (by using default emission factors) is followed in the absence of country-specific emission factors.

The assessment has pooled data from relevant stakeholder departments of the Government of Kerala as well as the data available in national-level portals. However, the best efforts were made to source both activity data and emission factors that are available at the State level, and wherever possible, a Tier 2 method was followed.

All computations in the report are based on the Global Warming Potentials (GWP) of greenhouse gases for a 100-year timeframe, as per IPCC AR2 (IPCC, 1995) (see Box 1.2). Although GWP AR2, GWP AR6 and GTP AR6-based emission values are estimated as part of the inventory, only the GWP AR2 values are presented in this report. This is following the practice followed by the Government of India in GHG inventory reporting. A detailed overview of the various sectors, sub-sectors, and categories for which emissions have occurred along with an analysis of emission trends has been provided.

Box 1.3. Tiers of GHG emission inventory

Based on the level of data requirements, degree of details incorporated and the usage of emission factors, IPCC suggests three tiers. Tier 1 is the basic approach that derives data from already assessed baselines and from default emission factors identified by the IPCC. Tier 2 employ more specific and accurate activity data and more region-specific emission factors. Tier 3 has the highest level of precision, employing spatially disaggregated site-specific data collection and often include advanced modeling techniques.

In alignment with the base year followed in India's Nationally Determined Contribution Commitment under the Paris Agreement,¹⁰ the report takes 2005 as the base year and the reference period is 2005 to 2023.

Detailed sector-based information on sources of activity data, emission factors, methodology and formulae are given in *Annexure-1*. The type of emission factors and level of methodological tier employed for GHG emission estimation are given in *Appendix 1A*. GWP for the gases is given in *Appendix 2*.

The sub-sectors and categories identified under each sector that are relevant for GHG emissions estimation in Kerala are listed in *Appendix 1¹¹*.

9 India. Biennial Update Report (BUR). BUR3

10 India. Biennial Update Report (BUR). BUR1

11 This report considers Sector-Subsector-Category terminology for policy purposes. IPCC follows the Sector-Category-Sub Category terminology

4

Comparability of the Report

The 2006 IPCC Guidelines for National Greenhouse Gas Inventories took the transition to an integrated approach in GHG Reporting¹². This approach integrates the previous (Revised 1996 IPCC Guidelines) separate guidance for Agriculture and Land Use, Land-Use Change and Forestry (LULUCF) to form the Agriculture, Forestry and Other Land Use (AFOLU) guidance. This integration recognizes that the processes underlying greenhouse gas emissions and removals, as well as the different forms of terrestrial carbon

stocks, can occur across all types of land. It recognizes that land-use changes can involve all types of land. However, the transition to the 2006 reporting has happened at a slower pace and many nations including India currently follow the previous mode of reporting in GHG inventory. To ensure comparability with the national emissions and emission reporting, this report follows the current Indian national government reporting method in accordance with the UNFCCC/Paris Agreement tables and the NATCOM-3¹³ of India.

12 The UNFCCC reporting guidelines on annual inventories for Annex I Parties (decision 24/CP.19) require that Annex I Parties should use of the 2006 IPCC Guidelines for National Greenhouse Gas Inventories

13 The Ministry of Environment and Forests (MoEFCC), Government of India, has initiated a National Communication (NATCOM) project for communicating to the UNFCCC about anthropogenic emissions of GHGs from various sources and their removal by sinks not controlled by the Montreal Protocol. NATCOM is as per the commitment under UNFCCC.

Recent Trends in GHG Emissions from Kerala

In 2023, Kerala emitted 25.60 million tonnes of carbon dioxide equivalent (MtCO₂e), which is 8.6% higher compared to the 2005 emissions of 23.57 MtCO₂e (see figure-ER-1). Gross emissions¹⁴ recorded a sharp fall of 12% in 2020 relative to the previous year and increased by ~18% in 2023 (see figure-ER-3). Between 2020 and 2023, the increase in total greenhouse gas emissions was largely driven by an increase in CO₂ emissions from fossil fuel combustion across most end-use categories. This was partly due to increased energy use from the continued rebound of economic activity after the COVID-19 pandemic-induced slump in 2020.

The Energy sector dominated the emission spectrum in the state in 2023 with a total emission of 20.64 MtCO₂e, accounting for ~81% of the State's gross emissions.

Net emissions from the State, after accounting for the removals through sequestration, stood at 7.17 MtCO₂e in 2020 and 10.99 MtCO₂e in 2023, with ~16% average year-on-year rise. In per capita terms, a person in Kerala owned 0.31 tCO₂e in 2023¹⁵. Compared with the National per capita emission as per the latest available emission estimates, Kerala's per capita emissions were 0.64 tCO₂e and that of India were 2.46 tCO₂e in 2019 (see figure ER-2).

¹⁴ Gross emission is emissions excluding LULUCF and Net emission is emission inclusive of the LULUCF

*The LULUCF sector comprises biomass burning in forestland removals/ emissions due to changes in the land-use pattern

¹⁵ Based on Projected Population in the state for the year 2023 as per Population Projections of India and States 2011-2036, Census of India

6

Long-term GHG Emissions and Removals-Trends of Kerala

The Long-term gross emissions in the State have been growing at an average rate of 0.60%. The Long-term emissions profile across the reference period has been dominated by emissions from the Energy sector. Even though all sectors other than the Energy sector have recorded a declining trend in emissions in the long term (see figure-ER-6), this cannot be exclusively attributed to any concentrated effort of decarbonization but may be due to such

factors that have determined the scale and size of various activities in the concerned sectors in the long term. The Long-term gross annual average emissions of Kerala across the 18-year reference period were estimated to be 22.33 MtCO₂e per year, which in absolute terms were the lowest in 2007 (Figure-ER-1). From 2007 it grew at an average rate of ~1% annually to reach peak emissions of 25.60 MtCO₂e in 2023 (Figure- ER-1).

Figure-ER-1: Kerala Long-term Gross & Net Greenhouse Gas Emissions and Removals - Shows the overall trends in Greenhouse Gas emissions from Kerala in the long term (2005-2023). The dotted line shows the total CO₂ removals through carbon sequestration.

Figure-ER-2: Per Capita GHG Emissions -India and Kerala -2019- Based on Projected Population in the State for the year 2019 as per Census of India. India's per capita emissions for 2019, as per the latest estimates available with India's Long-term Low-Carbon Development Strategy submission to UNFCCC.

The annual average removal of CO₂ through carbon sequestration by the sinks in the state remained at -15.59 MtCO₂e per year. The detailed profile of removals/emissions from the LULUCF sector which accounts for the removals in the long term is given in *Section 8.4*. The removal by carbon sequestration offset ~57% of gross CO₂e emissions in 2023. It may be seen that the average sequestration of the state has remained robustly ~71% across the long term in the reference period. This is primarily due to the recorded forest cover of 57% along with the increasing trend of forest cover acting as a large source of carbon sink. The increase in forest cover declined to 0.26% between 2018 and 2019, compared to 1.99% during 2016–2017, leading to reduced carbon sequestration. However, from 2020 onwards, forest cover recorded a steady annual growth of about 1.85–1.90%, contributing to a significant rise in carbon sequestration¹⁶. (see *figure ER-4*).

Figure-ER-3: Long-term percentage changes (Year-on-Year) in gross greenhouse gas emissions, Kerala. The dotted line shows the trend in the changes (two-period moving average).

16 India State of Forest Report (various)

Figure ER-4: Total Removals in the Long term from sink categories in the state. The figure shows the quantity of atmospheric CO₂ sequestered as carbon in vegetation and soils in terrestrial ecosystems. The dotted line shows the best-fit trendline.

Of the total gross emissions in 2023, ~81% of the emissions was from the Energy sector (see figure ER-5). It amounts to 20.64 MtCO₂e. The significant emissions from the Energy sector over the long term, surpass those of the Industrial Processes and Product Use (IPPU) sector by more than tenfold. Similarly, when comparing the cumulative emissions of both Agriculture and Waste sectors, they are nearly six times lower than the Energy sector's accumulated emissions over the same period.

The Waste sector was the second largest emitter with total emissions of 1.92 MtCO₂e In 2023, accounting for ~7% of the Gross GHG emissions of the State (Figure ER-5). Whereas the Agriculture sector, which was the third largest emitter, contributed 1.57 MtCO₂e in 2023,

accounting for 6.14% of the state's Gross emissions. The contribution of the IPPU sector was the least in 2023, with a total GHG emissions of 1.47 MtCO₂e and accounting for 5.74 % of the Gross emissions. At the national level also, the Energy sector leads the emission trends. Nationally, the Energy sector accounted for 75.66 % of the total emissions in 2020.¹⁷

Figure ER-5 shows the absolute share of each sector in 2005 and 2023. However, it has to be noted that other than the Energy sector all other sectors have recorded lower emissions in 2023 compared to 2005. (See figure-ER-6) This is discussed in the subsequent sections.

The increase in total greenhouse gas emissions was driven largely by an increase in CO₂ emissions from fossil fuel combustion across most end-use categories.

Emissions by Greenhouse Gases

The primary greenhouse gas emitted by human activities in Kerala is carbon dioxide (CO₂), representing 69% of total greenhouse gas emissions¹⁸.

The largest source of CO₂ and overall greenhouse gas emissions is fossil fuel combustion, primarily from transportation and residential emissions. Methane (CH₄) is significantly more effective than CO₂ at trapping heat in the atmosphere: by a factor of 21 over a 100-year time frame (IPCC 1996). Methane emissions in Kerala in 2023 were 0.13 million tonnes. The major sources of methane emissions in the State include enteric fermentation in domestic livestock, rice cultivation and waste management. Nitrous oxide (N₂O) is produced by biological processes

that occur in soil and water and by various anthropogenic activities in the agricultural, energy, industrial, and waste management fields. Even though total N₂O emissions are much lower than CO₂ emissions, as per IPCC AR2, N₂O is 310 times more powerful than CO₂ at trapping heat in the atmosphere over a 100-year time frame (IPCC 1996). Nitrous oxide (N₂O) emissions in Kerala 2023 were 3742.89 tonnes. The major sources of N₂O emissions in the State are agricultural soil management, wastewater treatment, and fuel combustion in motor vehicles. Figures ER7(a), (b) and (c) illustrate the trends and yearly contributions of the major greenhouse gases in more detail. Sector-based emission of these gases in 2023 is given in Table 2.

¹⁸ The total greenhouse gas emissions due to anthropogenic activities include sum of emissions of carbon-dioxide (CO₂), methane (CH₄) and nitrous oxide (NO₂) and minor trace gases such as hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and sulphur hexafluoride (SF₆) emissions. Notably, emissions of trace gases primarily stem from industrial processes, such as aluminium and magnesium production, that are not encompassed within the scope of this inventory and hence not reflected herein. Furthermore, it may be noted that the choice of data source for industrial energy fuel consumption, namely Pillai N, V., Am, N. (2019), was determined after extensive consultations and discussions with relevant stakeholders. Consequently, certain additional fuels not present in the selected data source or considered irrelevant have been kept outside the purview of this inventory.

Figure-ER-7: Long-term emissions trend of various Greenhouse Gases. Panel (a) shows the Long-term emission trend of Carbon dioxide which shows an increasing trend, panel (b) shows the Long-term emission trend of Methane in (Million tonnes) and panel (c) shows the Long-term emission trend of Nitrous Oxide. Both methane and Nitrous Oxide show a declining trend in emissions. The dotted lines show the linear trend.

Table 2: Sector-based and Gas-based GHG Emissions (2023)

Overview of Sectoral Emissions and Trends in Kerala: 2005 to 2023

8.1 Energy Sector

The Energy sector contains emissions of all greenhouse gases resulting from stationary and mobile energy activities including fuel combustion and fugitive fuel emissions, and the use of fossil fuels for non-energy purposes. In 2023, the Energy sector contributed 20.64

MtCO₂e emissions in Kerala, accounting for ~81 % of the State's total emissions. This was the highest level recorded during the reference period, representing a 35% increase compared to the lowest level of 15.33 MtCO₂e observed in 2007. When compared with the baseline emissions (2005 levels) the energy use emissions stood ~14% higher in 2023 (*see figure-ER-8*).

Figure-ER-8: Long-term emissions trend in the Energy sector.

The Energy sector emissions comprise emissions from two sub-sectors; fuel combustion and fugitive emissions. Fuel combustion emission arises out of sources like Transport, Public Electricity Generation, Captive Power Plants,

Industries, Commercial, Residential, Fisheries and Agriculture categories. Fugitive emissions are accounted for emissions occurring during fuel production. *Figure ER-9* shows the emission trend from various source categories during the reference period.

Figure-ER-9: Long-term Emission trend-Energy use categories - Shows the Long-term trend in emissions from the various emission sources in the Energy sector contributing to the overall sector emission. Transport emissions are the cumulated emissions from various sources like road transport, railways, aviation and navigation.

Energy sector emissions declined by 15% from 20.09 MtCO₂e in 2019 to 17.09 MtCO₂e in 2020, largely due to the sharp reduction in fuel combustion from transport activities amid COVID-19 induced mobility restrictions across the State. However, recent trends indicate a steady rebound, with emissions rising by 21% from 2020 levels to reach 20.64 MtCO₂e in 2023- approaching the pre-COVID peak recorded in 2019.

The key sub-sector contributing to Kerala's Energy sector emissions were the transport sub-sector. The fossil fuel combustion

emission associated with transportation activities alone accounted for 13.59 MtCO₂e in 2023, constituting ~66% of the total Energy sector emissions, and 53% of the gross emissions of Kerala. (see *figure ER-9*). The second highest contributor to the Energy sector emissions was the residential category emissions emerging from consumption of LPG and kerosene, with total emissions of 3.20 MtCO₂e in 2023, constituting ~16% of the State's total Energy sector emissions, and ~12% of the gross emissions. These sub-sectors are followed by Industrial Energy emissions, with 1.89 MtCO₂e

in 2023, constituting ~9% of the total Energy sector emissions of the State, and 7% of the gross emissions. Industrial energy emissions emerge from the industrial consumption of fuels including Naphtha, HSD, LDO, FO/LSHS Natural Gas and Petcoke.

Of the various source categories in the Transport sub-sector, Road Transport was the major contributor with a share of 87% in 2023, followed by the Aviation category, with a share of ~12% in 2023.

Emissions share of Railways and Water-borne Navigation categories were 0.17% and 0.34% respectively, in 2023. Between 2005 and 2023, the emissions from the Road Transport category increased from 4.01 MtCO₂e to 11.83 MtCO₂e whereas the emissions from the Aviation category increased from 0.41 MtCO₂e in 2005 to 1.69 MtCO₂e in 2023.

Figure ER-10: Category-based Emissions and Percentage Share in Total Energy sector Emissions (2023) - The figure shows the Category-based Emissions in MtCO₂e and percentage share in total Energy sector Emissions in 2023. Transport and residential categories emit the maximum greenhouse gases in the State in 2023.

Among the Fuel Combustion sources, emissions from Liquid Petroleum Fuels¹⁹ remained the highest, with an average share of ~81% between 2005 and 2023 due to its usage in transport, agriculture, commercial, fisheries, residential, captive power plants and industries. This was followed by combustion involving Gaseous

Petroleum Fuels²⁰, with an average share of ~17%. Coal (used in captive power plants) and petcoke (used in industries) together contributed ~2% of the overall fuel combustion emissions, throughout the reference period.

The emissions from Gaseous Petroleum Fuels increased between 2015 and 2023 due to the increased share of Gas use by Captive Power

¹⁹ Liquid Petroleum Fuels include Aviation Turbine Fuel, Diesel, Kerosene, Motor spirit(petrol) and other liquid fuels

²⁰ Gaseous Petroleum Fuels include Natural Gas, LPG and other gaseous fuels

Plants and LPG use in the Residential category. Whereas the emissions from Liquid Petroleum Fuels declined between 2015 and 2023 due to a reduction in Naphtha and High-Speed Diesel (HSD) consumption for Public Electricity Generation. Moreover, the consumption of kerosene in the Residential category also

decreased after 2010. Among the major gaseous fuels, emissions from LPG recorded an average growth of 5% per year. The emissions from Diesel have recorded a 35% decline from its emission levels in the baseline year. A gradual transition to the use of cleaner fuels is evident across the long term.

Figure-ER-11: Long-term Emissions Trend – Major Fuel Categories – The figure shows the Long-term trend of liquid/ gaseous fuels that have the highest contribution to the total emission in the Energy Sector. There are combustion emissions from other fuels accounted for in the emission inventory including Naphtha and natural gas which are not represented in the graph. [LPG- Liquefied Petroleum Gas, ATF- Aviation Turbine Fuel]

Kerala has all four modes of transport. Road transport leads the emission trend in the Transport category. It may be noted that from 4.01 MtCO₂e in 2005, the emission from this category has recorded a steady growth to 10.43 MtCO₂e in 2019 which is a 160% growth (see figure-ER-12 (a)). However, the emissions from road transport fell ~10% in 2020 to 9.40 MtCO₂e due to the pandemic-related restrictions and rebounded to reach a peak of 11.83 MtCO₂e in 2023. The State had announced its Electric Vehicle (EV) Policy in 2019 and aimed to introduce one million EVs by 2022 which was however missed.

In contrast, the emissions from the railways have come down drastically due to the electrification of the lines see figure-ER-12 (b). In 2005 the railways emitted 8 MtCO₂e which came down 99.7% to reach 0.02 MtCO₂e in 2023. However, this cannot be said as a reduction in the carbon footprint of the railways due to decarbonization, as a significant share of its power requirement is still met from power generated from non-renewable sources. For the present assessments as per the IPCC methodology, only emissions occurring within the regional boundary of Kerala have been taken into consideration²¹ and

21 2006 IPCC Guidelines for National Greenhouse Gas Inventories, Volume 1: General Guidance and Reporting

Figure-ER-12: (a), (b), (c) &(d)| Long-term Emission Trends Various Transport Categories.

hence this is not accounted for. The railways have however planned to gradually reduce their carbon footprint and become a net zero carbon emitter by 2030 primarily through sourcing its energy requirements from renewable energy sources²².

Water transport is a significant mode of transport in Kerala. 53.98% of the total available 2988.61km river/canal stretch in Kerala is Navigable (Gol 2021). The West Coast Canal from Kottapuram to Kollam (168 km) together with Champakara Canal (14 km) and Udyogmandal Canal (23 km) was declared as National Waterways-3. 16.95 lakh tonnes of cargo were handled by the NW-3 alone in 2021²³. Parallely The Kerala State Water Transport Department transports about 150 lakh passengers per annum²⁴.

8.2 Industrial Processes and Product Use (IPPU) sector

The IPPU sector accounted for 1.47 MtCO₂e emissions of Kerala in 2023, which is ~6% of the State's gross emissions. Emissions from the IPPU sector are largely driven by the Chemical, Metal, Mineral Industries and Non-Energy Products from Fuels and Solvent Use. Major chemical industries in Kerala are involved in the production of ammonia, caprolactam, carbon black, titanium dioxide and soda ash. The Mineral Industry in Kerala is largely dominated by the production of cement and lime. Similarly, steel and zinc production dominated the metal industry in Kerala. The Non-Energy Products from the Fuels and Solvent Use sub-sector comprise lubricants and paraffin wax used in

Figure-ER-13: Long-term Emissions Industrial Processes and Product Use (IPPU).
The emissions trend is led by the Chemical Industry.

²² <https://pib.gov.in/PressReleasePage.aspx?PRID=1865754>

²³ Statistics of Inland Water Transport 2021-22, Ministry of Ports, Shipping and Waterways

²⁴ <https://www.swtd.kerala.gov.in/pages-en-IN/aboutdept.php>

the State. GHG emissions from the IPPU sector of Kerala declined from 1.47 MtCO₂e in 2005 to 1.32 MtCO₂e in 2021 and rebounded to 1.47 MtCO₂e in 2023 (see figure ER-13).

The key sub-sector contributing to Kerala's IPPU sector emissions was the Chemical Industry with a total emission of 1.20 MtCO₂e, constituting ~82% of the total IPPU sector emissions of Kerala, and ~6 % of the State's gross emissions in 2023. The second highest contributor to the IPPU sector emissions was emissions from the Mineral Industry with a total emission of 0.20 MtCO₂e, constituting ~14% of the total IPPU sector emissions of Kerala, in 2023 and ~1% of the State's gross emissions.

Emissions from the Chemical Industry showed minor fluctuations over the years, remaining nearly steady between 1.19 MtCO₂e in 2005 and 1.20 MtCO₂e in 2023, indicating a relatively stable emission trend throughout the period.

Similarly, the decline in metal industry emissions could be attributed to the closure of the only zinc-producing plant that was operating in Kerala.

Within the Chemical Industry, the Production of Ammonia was the key contributor to GHG emissions in the IPPU sector, throughout the reference period. Its share of emissions in the IPPU sector increased from ~49.07% in 2005, to ~49.15 % in 2023(see figure 14). This was followed by the emissions due to the production of Carbon Black and Cement.

8.3 Agriculture Sector

The Agriculture sector emissions arise broadly from two sub-sectors: Agriculture Practices and Livestock. The major sources of emissions from the Agricultural sector are, enteric fermentation in domestic livestock, livestock manure management, agricultural soil management, rice

* Others include Soda Ash Production and Titanium Dioxide

Figure-ER-14: Emissions from Sub-Sectors and Major Categories - Percentage Share in Total IPPU Emissions- Chemical Industry accounting for 82% of the emissions in IPPU is mainly from the production of Ammonia and Carbon Black. (both being produced by Fertilizers and Chemicals Travancore Limited (FACT) and Philips Carbon Black).

cultivation, urea fertilization, liming, and field burning of agricultural residues²⁵.

In 2023, agricultural activities were responsible for 1.57 MtCO₂e of GHG emissions, which was 6% of total gross greenhouse gas emissions in the State. Emissions from the Agriculture Practices sub-sector have been accounted for from Agriculture Soils, Biomass Burning in Cropland

and from Rice Cultivation. The Livestock sub-sector emissions have been accounted for from Enteric Fermentation and Manure Management emissions.

It has to be noted that the GHG emissions from the Agriculture sector show a declining trend in the long term. From 2.02 MtCO₂e in 2005, it fell ~22% to 1.57 MtCO₂e in 2023 (see Figures ER-15)

Figure-ER-15: Long-term emissions from the Agriculture Sector Agriculture total is the cumulation of emissions from agricultural practices and Livestock.

Figure-ER-16: Long-term Emissions- Various Categories in the Agriculture Sector

²⁵ Agriculture releases significant amounts of CO₂, CH₄, and N₂O to the atmosphere (Cole et al., 1997; IPCC, 2001; Paustian et al., 2004). CO₂ is released largely from microbial decay or burning of plant litter and soil organic matter (Janzen, 2004). CH₄ is produced when organic materials decompose in oxygen-deprived conditions, notably from fermentative digestion by ruminant livestock, from stored manures, and from rice grown under flooded conditions (Mosier et al. 1998). N₂O is generated by the microbial transformation of nitrogen in soils and manures and is often enhanced where available nitrogen (N) exceeds plant requirements, especially under wet conditions (Oenema et al., 2005; Smith and Conen, 2004).

Figure-ER-17: Recent- Category-based Emissions in Agriculture and Percentage Share

Within the Livestock sub-sector, the Enteric Fermentation category was the major contributor to the total Agriculture emissions, with a Long-term average share of ~64%. Between 2005 and 2023, the emissions from this category declined ~26% from 1.37 MtCO₂e to 1.01 MtCO₂e recording an average decline of ~2% per year. Considering the recent trend, the livestock sub-sector emitted 1.13 MtCO₂e, in 2023 constituting ~72% of the total emissions from the sector. The remaining ~28% share of the State's agriculture emissions was from Agriculture Practices, arising out of activities including rice cultivation, biomass burning and soil management amounting to a total emission of 0.44 MtCO₂e.

A sharp dip in overall emissions in 2016 and an immediate rebound in 2017 can be observed which may be attributed to the change in fertilizer consumption pattern in these years (see figure ER-16). No traceable impacts of the pandemic can be observed in the recent emission trend in the Agriculture sector. Within

the Agriculture Practices, Agricultural Soils and Rice Cultivation were the key contributors to Agriculture emissions, with average shares of ~18% and ~12%, respectively, throughout the reference period. The emissions from Agriculture Soils increased at an average rate of 1.2%, while emissions from Rice Cultivation decreased at an average rate of 2% in the long term (2005 to 2023).

8.4 Land Use, Land-Use Change and Forestry (LULUCF)

The LULUCF sector includes removals and emissions of CO₂ from managed lands and emissions of CH₄ and N₂O from Biomass Burning in Forestland. Consistent with the 2006 IPCC Guidelines, emissions and removals from managed lands are considered to be anthropogenic, while emissions and removals from unmanaged lands are considered to be natural.²⁶

²⁶ See http://www.ipcc-nggip.iges.or.jp/public/2006gl/pdf/4_Volume4/V4_01_Ch1_Introduction.pdf

Figure-ER-18: Long-term GHG Emissions/ Removals of the LULUCF sector. Shows removals from all land use classes and emissions from Biomass Burning in Forestland, Grassland and Other Land categories. The removals from Forest Land and the overall removals from LULUCF sector are visible in the graph. Emissions from various source categories in the LULUCF Sector are proportionately very less in the case of Kerala. (~0.14% of total CO₂ sequestered) thus it cannot be represented in comparative scales.

The LULUCF sector acted as a net sink for CO₂ (carbon sequestration) for the entire reference period in Kerala. On average, land category in the LULUCF has sequestered ~15.59 MtCO₂e yearly across the reference period. In 2023 the land category has sequestered ~57% of the gross CO₂e emissions from the State. Primary drivers of fluxes on lands include forests, and the main drivers for forest carbon sequestration include increase in carbon stock density and forest cover. Thus, Forest land becomes the major sink category in the LULUCF sector.

There are emissions accounted for in the LULUCF sector, which include emissions from Agriculture Land, Forest Land, Grassland, Other Land²⁷, Settlements²⁸ and Biomass burning

in Forestland. Biomass burning in Forestland remained an emitting source throughout the reference period.

As seen in Figure ER-18, Forest Land has been the major source of carbon sequestration in the long period. Between 2009 and 2015, there was a noticeable increase in the net sink which can be attributed to the increase in forest cover. After 2015, there is a lesser increase in the forest cover and a reduction in the forest carbon stock density²⁹ Notably, between 2018 and 2019, a major decline in the sequestration was observed as the forest cover increased only at a rate

soils, herbaceous perennial vegetation such as turf grass and garden plants, trees in rural settlements, homestead gardens and urban areas. (IPCC, 2006)

27 Other Land includes Barren Land/ Unculturable/wastelands

28 Settlements are defined as all developed lands -- i.e., residential, transportation, commercial, and production (commercial, manufacturing) infrastructure of any size, unless it is already included under other land-use categories. Settlements includes

29 As reported by the India State of Forest Reports, (Various), of Forest Survey of India (FSI). The changes in soil carbon stock density as in the FSI data have impacted the variations in the sink estimates than can be observed across periods, 2008-2017. This may require detailed assessments at the micro level which is not in the purview of this report.

Figure-ER-19: Category-based Removals and their Percentage Shares (2023). Emissions from the LULUCF sector are proportionately very less in the case of Kerala. (~0.10% of total CO₂ sequestered)

Figure-ER-20: Long-term GHG Emissions Estimates of Waste Sector

of 0.26% during the period. However, in 2021, the forest cover increased at a rate of 3.8% as compared to 2019 along with a steady growth in the carbon stock density, leading to a significant increase in the sequestration between the period³⁰ (see *Appendix 5* for Forest cover and Carbon stock density).

Emissions from Biomass burning in the forest-land category declined considerably in the long term. These reductions in emissions could be attributed to the decline in the forest area burnt.

Removals from the Agricultural land declined at a rate of 2% from 0.35 MtCO₂e to 0.24 MtCO₂e. Whereas, removals from Settlements increased at a rate of 6.01% from 0.02 MtCO₂e to 0.05 MtCO₂e. Grassland and Other Land categories

³⁰ ISFR, FSI Various

remained a sink until 2011. However, from 2012 these two categories became sources of emissions. Together, they emitted 0.014 Mt CO₂e annually, between 2012 and 2023. This was due to the conversion of *Forest Land* to *Other land* and *Grassland*, and the conversion of *Wetlands* to *Other Lands*, between 2005-06 and 2015-16³¹

The overall net flux from LULUCF (i.e., the net sum of all CH₄ and N₂O emissions to the atmosphere plus net carbon stock changes in units of MtCO₂e) resulted in a removal of 14.61 MtCO₂e in 2023.

8.5 Waste Sector

The waste sector emitted 1.92 MtCO₂e accounting for ~7% of the gross emissions in the State. Solid Waste Disposal, Domestic Wastewater and Industrial Wastewater are the contributing categories.

Industrial wastewater emissions from Kerala have been estimated for, meat, paper and pulp, petroleum, dairy, tannery, and fish processing industries. The industry categories that have

been identified for estimating Kerala's industrial wastewater emissions are in line with those that have been listed in India's National Communications/ 2006 IPCC guidelines for National GHG inventories.

GHG emissions from the Waste sector of Kerala marginally declined from 1.94 MtCO₂e in 2005, to 1.92 MtCO₂e in 2023 (see figure ER-20).

Domestic Wastewater, with total emissions of 1.85 MtCO₂e, constitutes ~96% of the total Waste sector emissions, and 7% of the gross emissions of Kerala in 2023.

One of the contributing factors to these emissions could be the absence of piped sewer systems in peri urban areas, and relatively low coverage in urban areas, owing to the geographical constraints.

The industrial waste water and Solid Waste Disposal, respectively contributed 0.04 MtCO₂e and 0.03 MtCO₂e. (see figure ER-21).

The emissions from Solid Waste Disposal decreased significantly by 6.6% annually from 0.11 MtCO₂e in 2005 to 0.03 MtCO₂e in 2023.

Figure-ER-21: Category-based Emissions and Percentage Shares in Total Waste Sector Emissions.

31 As per the Land Use Land Cover Change Matrix of Kerala, obtained from the Envistats 2018 and 2020 (Supplement of Environmental Accounts)- Ministry of Statistics and Programme Implementations (MOSPI). Govt of India

This decline reflects substantial improvements in solid waste management across the State. Notable, the treatment of municipal solid waste rose from 52% in 2019-20 to 93% in 2022-23 (GoK, 2023). The Haritha Karma Sena Self Help Groups (SHGs) have been instrumental in driving this progress, effectively managing waste in both rural and urban areas.

Emissions from Domestic Wastewater increased by 3% from 1.80 MtCO₂e in 2005, to 1.85 MtCO₂e in 2023. Discharge of untreated wastewater and use of septic tanks are the key sources of emissions in the Domestic Wastewater category.

Kerala Water Authority (KWA) that has the management systems for collection and disposal of wastewater has 4% underground drainage (UGD) coverage of the State, which

is mainly confined to Thiruvananthapuram and Kochi Corporations. The need for more focused approach for enhancing wastewater management is essential. However, issues related to funds, public protest against sewage plants and pump houses, delay in getting land and sanctions for road cutting, causes delay in initiating sewerage projects (GoK, 2023). KWA envisages new small-scale projects sufficient for 2 to 3 ward clusters. Latest technologies incorporating the reuse of treated effluent as specified by National Green Tribunal (NGT) is proposed to be used in these projects.

Emissions from Industrial wastewater management has marginally increased from 0.03 MtCO₂e in 2005 to 0.04 MtCO₂e in 2023, with key contributions from Pulp and Paper (49.43%) and petroleum industry (41.63%)

* Emissions in MtCO₂e, 2023

Figure-ER-22: Category-based Emissions and Percentage Share in Total Industrial Wastewater Emissions.

9

Key Categories

Of the 35 categories³² considered in this assessment across five sectors (Appendix 1A), the Transport and Residential categories were the major contributors to the overall gross emissions of the State with shares of 53% and 12% respectively (Figure ER-23). Even if the emissions are considered based on economic sectors, it has to be noted that transport and residential emissions score high above emissions from industries, agriculture, commercial and public utility emissions in Kerala.

Figure-ER-23: Percentage share of Key Categories in overall Gross Emissions (2023)

Shows the Key categories as per the 2006 IPCC Guidelines for National Greenhouse Gas Inventories are "inventory categories which individually, or as a group of categories are prioritized within the inventory system because their estimates have a significant influence on the total inventory of greenhouse gases in terms of the absolute level or the trend. (IPCC 2006).

32 Chapter 4 "Methodological Choice and Identification of Key Categories" in IPCC (2006)

Summary Inferences

The Energy sector activities accounting for the overall carbon dioxide emissions lead the emissions profile in the State. The strategies based on the assessment given here shall be detailed in the emissions pathway that is being developed. However, the policy direction that needs to be highlighted in the State's climate change policy, as proposed in the SAPCC 2.0 shall be primarily in envisaging clean transport mechanisms, including strategies like shared mobility and enhanced public transport infrastructure.

P1 Carbon neutrality in the State largely depends upon, emission reductions from the transport sub-sector, specifically in the road transport category.

P2 About 13 per cent of the road network in Kerala handles almost 80 per cent of the traffic in the State (GoK, 2023b). Hence besides greenhouse gas emissions reduction, alternative transport mechanisms have added relevance in Kerala. It has to be noted that a total length of 1926.87 km of navigable waterways is available in the State³³

P3 The dominance of emissions from diesel in the fuel category is prominent. A transition from diesel to comparatively cleaner fuel types is a necessity in the long run as diesel dominates the emission profile. Moreover, electrification of the transport sector is the key for decarbonization.

P4 The average long-term net emissions in Kerala amount to 6.75 MtCO₂e. The recent net emissions amount to 10.99 MtCO₂e and show an increasing trend. To achieve carbon neutrality, essential pathways need to be derived to establish the directions and route map towards net zero emissions.

P5 If sub-sector-based emissions are compared, the residential sub-sector in the Energy sector is an emitter much higher than the Waste Sector as a whole.

P6 Forest Land category is the fundamental sink in the state, hence maintaining the quality of the forests has much significance in sustaining its sequestration potential.

P7 It is to be noted that as per India's Long-term Low-Emissions Development Strategy (LT-LEDs), agriculture is not included in LT-LEDs, given its predominantly adaptation-related character; especially in the context of India's agriculture which has predominance of small and marginal farmers. "The absence of large-scale or "industrial agriculture" in India indicates that the burden of mitigating GHG emissions from other sectors cannot be passed on to the agricultural sector" (MoEFCC 2023). In Kerala, the average land holding size is 0.13ha. Thus, in the context of the above and the relative share of emissions from agricultural practices in the State, as detailed in this report, policies and programmes in the agriculture sector aiming at carbon neutrality need thorough re-alignment in retaining agricultural productivity.³⁴

³³ Of which NW-3 is the longest water way. The volume of cargo on National Water Ways-3 alone has increased to 16.95 lakh tonnes in 2021-22 from 7.38 lakh tonnes in 2020-21 recording an increase of 129.54%

³⁴ Article 4, Para 19 of the Paris Agreement

Quality Control and Quality Assurance

The GHG inventory development for Kerala adhered to a rigorous approach aimed at ensuring the publishing of high-quality results. The process prioritized the reusability of the published datasets and emphasized transparency in both methodology and activity data used for emissions estimation.

Key quality control and quality assurance measures followed include:

- Activity data and data sources used for all related categories across sectors were verified for their time-series consistency and transcription errors on a sample basis.
- Where applicable, alternate sources of information were explored not only to plug the data gaps but also to validate the activity data, before finalizing the emissions estimates, ensuring accuracy and reliability.
- Verification of data, methodology, and emissions estimates was done at the category level by both the Vasudha team and the Directorate of Environment and Climate Change to maintain accuracy and consistency.
- Regular meetings with relevant line departments were conducted to verify emissions trajectories, identification of anomalies, and ensure the reasonability of assumptions.
- For most key categories, emissions trends were closely examined for abrupt deviations from the business-as-usual scenario.
- The best available activity data following IPCC guidelines had been used to develop this inventory.
- Country-specific and state-specific emission factors or studies were employed where relevant and available, enhancing the accuracy of estimates.
- The worksheets were standardized with properly linked and labelled cells for easy tracking and validation of input data.
- Sources for activity data and emission/conversion factors used across all sectors were referenced in the methodology notes, most with weblinks, for accessibility and transparency.
- All identified gaps in the inventory were documented under limitations in the methodology notes for each sector, ensuring transparency and accountability.

12

Refinements and Insights

As in most of the assessments of GHG inventory, data was the most difficult part of the present assessment. Since most of the data for this assessment were retrieved from the State-owned entities, any data limitations arising at that end eventually has resulted in seeking proxies or relying on available data which may not be the latest or the most accurate data suitable for higher tier assessment. As an instance, the land use matrix of the State as available from various sources could not be relied upon as it was found to be inconsistent with ground features in the majority of the attributes. This might have affected the assessments in the LULUCF sector. For the IPPU sector assessments, a major bottleneck was the unavailability of reliable industrial production

data, which was complemented with installed capacity data. Above all, an assessment like a State Level GHG inventory may require voluminous data to be analyzed across years. A precondition for such assessments is the existence of databases that can be readily engaged. This was lacking in many cases even where it was possible using limited time and resources. It was felt the necessity of systematic database management systems in the stakeholder arms that would facilitate easy retrieval of data whenever in need. Despite these shortcomings, the inventory network has engaged the best information available at the time of assessment in this report. Suggestions regarding any future improvements in the assessments are welcome.

13

Way Forward

The assessment presented here shall be foundational to prioritize the sectors and actions for reducing GHG emissions in the State to achieve the 2050 Net Zero target. In this regard, the emission pathways shall be modelled. The pathway modelling shall enable the State to identify the gap between the business as usual and the policy scenario and shall help identify the measures that are required to leverage the necessary actions to achieve the policy scenario and the feasible timelines and finance. This shall also be supporting the stakeholder units to redesign their systems and portfolios to achieve the policy objective. The State shall also identify the possible risks and scopes in adopting the pathways to safeguard and supplement the near-term and Long-term development trajectory of the State. The Inventory exercise has generated a large pool of data which has the possibility of continuous

updating and monitoring. In this context, there is potential to enhance existing state capacity in sourcing high-quality activity data across sectors, particularly focusing on industrial processes/product use and industrial energy consumption. Such efforts would significantly enhance the robustness of the GHG inventory. An actionable initiative could involve expanding the scope of the annual survey of industries conducted by the Department of Economics and Statistics, Government of Kerala, to gather precise industrial fuel-wise consumption data, thereby enhancing the accuracy of industrial energy emissions estimations. As part of the

knowledge-sharing initiative of DoECC, the data and the assessment shall be fed to the State Climate Change portal for wider access and usability.

Appendix 2

Global Warming Potential, Factors Used

GHG	GWP 100 as per IPCC AR2 WGI	GWP 100 as per IPCC AR6 WGI	GTP AR6
CO ₂	1	1	1
CH ₄	21	27.9	5.38
N ₂ O	310	273	233

The Global Warming Potential (GWP) serves as a quantified metric indicating the globally averaged relative radiative forcing of a specific greenhouse gas. It is defined as the cumulative radiative forcing over a specific time horizon resulting from the emission of 1 kilogram (kg) of the gas, in comparison to the reference gas, CO₂.¹ Direct radiative effects occur when

the gas itself absorbs radiation, while indirect radiative forcing takes place through chemical transformations that produce greenhouse gases or influence other radiatively significant processes, such as the atmospheric lifetimes of other gases. All computations in the current report are based on the GWP of greenhouse gases for a 100-year timeframe, as per IPCC AR2 (IPCC, 1995).

MoSPI	Ministry of Statistics and Programme Implementation
Mt CO ₂ e	Million tonnes of carbon dioxide equivalent
NATCOM 2	India Second National Communication to United Nations Framework Convention on Climate Change
NCV	Net Calorific Value
PPAC	Petroleum Planning and Analysis Cell
TTPL	Travancore Titanium Products Limited

INTRODUCTION

The GHG inventory has been developed for the period 2005 to 2021, accounting for carbon-dioxide (CO₂), methane (CH₄) and nitrous oxide (N₂O) emissions. The inventory covers all the four sectors, namely, Energy, IPPU (Industrial Processes and Product Use), AFOLU (Agriculture, Forestry & Other Land Use) & Waste, and all relevant sub-sectors that contribute to the GHG emissions, as per the Intergovernmental Panel on Climate Change (IPCC) methodology and guidelines.^{1,2} However, for reporting purposes AFOLU has been bifurcated into Agriculture and LULUCF sectors, in alignment with the Government of India's GHG inventory reports.

The estimations are largely based on IPCC's Tier 1 and Tier 2 approaches of emissions estimation. In most cases, the Tier 1 (T1) or IPCC-suggested standard approach (by using default emission factors) is followed in the absence of country-specific emission factors. However, the best efforts were made to source both activity data and emission factors that are available at the state level. Wherever possible, the focus was on following a Tier 2 approach rather than a Tier 1 approach.

Detailed sector-wise information on activity data, emission factors, methodology/tiers followed and equations are given in the chapters below. The methodologies for each sub-sector/category are provided in the order of their IPCC category code.

Reporting Period:

The time period for the state-level GHG emission estimations and subsequently aggregated state-level GHG estimates is from 2005 to 2023. This inventory follows the base year of 2005 to align with the base year followed in India's Updated First Nationally Determined Contribution Under Paris Agreement.

¹ 2006 IPCC Guidelines for National Greenhouse Gas Inventories <https://www.ipcc-nggip.iges.or.jp/public/2006gl/>

² 2019 Refinement to the 2006 IPCC Guidelines for National Greenhouse Gas Inventories <https://www.ipcc-nggip.iges.or.jp/public/2019rf/>

ENERGY SECTOR

Key Highlights

- Energy sector accounts for ~ 81% of the gross GHG emissions (excluding LULUCF) in 2023 in Kerala. Emissions from the Energy sector declined from 18.13 Mt CO₂e in 2005 to 20.64 Mt CO₂e in 2023.
- Emissions from this sector peaked in 2019 at 20.09 Mt CO₂e, and declined significantly to 17.09 Mt CO₂e in 2020. This significant decline in emissions could be attributed to reduction in emissions from the Transport sector, primarily due to the strict imposition of Covid-19 related mobility restrictions in the state.
- Within the Energy sector, the Transport sector was the key contributing sub-sector in 2023, accounting for ~66%. This was followed by the Residential sub-sector (~16%) and Industrial Energy (~9%).

Figure 1: GHG Emissions Estimates of Energy Sector – Kerala (2005 to 2023)

Sector Description:

Energy systems are for most economies largely driven by the combustion of fossil fuels. During combustion the carbon and hydrogen of the fossil fuels are converted mainly into carbon dioxide (CO₂) and water (H₂O), releasing the chemical energy in the fuel as heat. This heat is generally either used directly or used (with some conversion losses) to produce mechanical energy, often to generate electricity or for transportation.³(IPCC,2006)

³ 2006 IPCC Guidelines for National Greenhouse Gas Inventories, Volume 2, Chapter-1

The Energy sector emissions comprises emissions from Fuel Combustion and Fugitive emissions. The following are the key sub-sectors/categories covered in the Energy sector's emissions estimates:

- 1A1 Energy Industries
 - 1A1 ai Public Electricity Generation
 - 1A1 aii Captive Power Plants
- 1A2 Industrial Energy
- 1A 3 Transport
 - 1A3a Civil aviation
 - 1A3b Road transportation
 - 1A3c Railways
 - 1A3d Water-borne navigation
- 1A4 Other Sectors
 - 1A4a Commercial/Institutional
 - 1A4b Residential
 - 1A4c- Agriculture/Fisheries
- 1B Fugitive Emissions From Fuels

Methodology:

The sources of activity data used for estimating emissions from the Energy sector is detailed below in Table 1. The fuel consumption data used for estimating emissions from sector/category for the years 2019, 2020, and 2023 is detailed in Table 2.

Table 1: Source of activity data⁴ used for estimating emissions from Energy sector

Sub-sector/ Category	Fuels	Years	Sources/ Assumptions
Energy Industries			
Public Electricity Generation	1.High Speed Diesel (HSD) and Naphtha fuels from State/ Private-owned Gas power plants; LSHS and Diesel Oil from State/ Private-owned Diesel power plants	(a) 2004-05 to 2010-11 and 2012-13 to 2017-18 (b) 2011- 12 (c) 2018-19 to 2022-23 (d) 2023	(a) Central Electricity Authority. <i>All India Electricity Statistics: General review Reports (accessed from hardcopy)</i> (b) CAGR method (c) Central Electricity Authority. <i>All India Electricity Statistics: : General review Reports</i> 2020 , 2021 , 2022 , 2023 and 2024 (d) CAGR method
	2. High Speed Diesel (HSD) and Naphtha fuels from Centrally- owned NTPC- Rajiv Gandhi Combined Cycle Power Plant	(a) 2004-05 to 2016-17 (b) 2017-18 and 2021-22 (c) 2022-23	(a) NTPC- Rajiv Gandhi Combined Cycle Power Plant's Proforma (b) HSD fuel data estimated using CAGR method. Whereas, the Naphtha fuel data was estimated based on Electricity Generation data from Kerala State Electricity Board's Power Statistics and Specific Gas consumption. (derived from Generation and Fuel Consumption value given in the Pro-forma) (c) Activity data from 2021–22 has been used due to the unavailability of recent data.
Captive Power Plants	Coal, Gas and Diesel	(a) 2004-05 to 2010-11 and 2012-13 to 2017-18 (b) 2011- 12	(a) Central Electricity Authority. <i>All India Electricity Statistics: General review Reports (accessed from hardcopy)</i> (b) CAGR method

⁴ Activity data provided in financial year (FY) format was converted to calendar year (CY) format using the following equations:

$$\text{CY Activity data} = [\frac{1}{4} * \text{FY Activity Data}_{\text{Preceding year}}] + [\frac{3}{4} * \text{FY Activity Data}_{\text{Succeeding year}}]$$

Sub-sector/ Category	Fuels	Years	Sources/ Assumptions
		(c) 2018-19 to 2022-23 (d) 2023	(c) Central Electricity Authority. <i>All India Electricity Statistics: : General review Reports</i> 2020 , 2021 , 2022 , 2023 and 2024 (d) CAGR method
Industrial Energy			
Industrial Energy	1. Naphtha	(a) 2007-08 to 2017-18 (b) 2004-05 to 2006-07 (c) 2018-19 to 2023-24	(a) Pillai, V. & AM Narayanan. (2019) (b) Naphtha consumption was assumed to be the same as the value reported for 2007-08. (c) CAGR method
	2. High Speed Diesel (HSD)	(a) 2007-08 to 2017-18 (b) 2004-05 to 2006-07 and 2018-19 to 2023-24	(a) Pillai, V. & AM Narayanan. (2019) (b) CAGR method
	3. Light Diesel Oil (LDO)	(a) 2007-08 to 2017-18 (b) 2004-05 to 2006-07 and 2018-19 to 2023-24	(a) Pillai, V. & AM Narayanan. (2019) (b) CAGR method
	4. Furnace Oil (FO)/ Low Sulphur Heavy Stock (LSHS)	(a) 2007-08 to 2017-18 (b) 2004-05 to 2006-07 and 2018-19 to 2023-24	(a) Pillai, V. & AM Narayanan. (2019) (b) CAGR method
	5. Natural Gas	(a) 2007-08 to 2017-18 (b) 2004-05 to 2006-07	(a) Pillai, V. & AM Narayanan. (2019)

Sub-sector/ Category	Fuels	Years	Sources/ Assumptions
		(c) 2018-19 to 2023-24	(b) Natural Gas consumption was assumed to be zero considering the values reported in year 2007-08 (c) Average value was applied based on 2016-17 and 2017-18 estimates.

1A1 Energy Industries

The emissions arising from the fuel usage primarily for Electricity Generation are estimated under this category. For Kerala, the emissions have been estimated for Public Electricity Generation and Captive Power Plants sub-sectors and use a combination of Tier 1 (T1) and Tier 2 (T2) approaches. The activity data, methodology and emission factors used for emission estimations are detailed below:

1A1ai Public Electricity Generation

The emissions from the Public Electricity Generation category were estimated from the electricity generating utility-based power plants.

Methodology:

Emissions from the Public Electricity Generation category were estimated using a combination of Tier 1 (T1) and Tier 2 (T2) approaches (see Table 3)

Table 3: Type of emissions factors and the level of methodological tier employed for GHG estimation

IPC C ID	GHG Sources and sink categories	CO ₂		CH ₄		N ₂ O	
		Method Applied	Emission Factor	Method Applied	Emission Factor	Method Applied	Emission Factor
1A1 ai	Public Electricity Generation	T1, T2	CS	T1	D	T1	D
T1: Tier 1, T2: Tier 2, D: IPCC Default, CS: Country-Specific							

The Net Calorific Value (NCV) of fuels and emission factors of Carbon dioxide (CO₂) were taken from INCCA Report (2010) and the emission factors of Methane (CH₄) and Nitrous Oxide (N₂O) were taken from 2006 IPCC Guidelines.⁵ Density of Diesel and Low Sulphur Heavy Stock (LSHS) were obtained from a Petroleum Planning and Analysis Cell, (2022) report, while the density of Naphtha was obtained from Central Electricity Authority, (2010) Annual fuel consumption report (see Table 4 and Table 5)

⁵ Emission Factors for Methane (CH₄) and Nitrous oxide (N₂O) were obtained from the 2006 IPCC Guidelines. There were no refinements made in the 2019 IPCC Guidelines.

Table 4: Emission Factors of Fuels

Fuels	INCCA		2006 IPCC	
	NCV (Tj/kt)	CO ₂ EF (t/TJ)	CH ₄ (kg/TJ)	N ₂ O (kg/TJ)
Diesel/High Speed Diesel	43.00	74.10	3.00	0.6
Low Sulphur Heavy Stock (LSHS)	40.20	73.30	3.00	0.6
Naphtha	43.00	74.10	3.00	0.6

Table 5: Density of Fuel used for the emissions estimates

Density of Fuels	Value
Naphtha*	1.35 kL/t
Diesel	1.21 kL/t
Low Sulphur Heavy Stock (LSHS)	1.042 kL/t

* As per CEA Annual Fuel consumption Report (2010) , 1 KL of Naphtha = 0.74 MT

The Activity data provided in financial year (FY) format was converted to calendar year (CY) format using the following equations:

$$\text{CY Activity data} = \left[\frac{1}{4} \times \text{FY Activity Data}_{\text{Preceding year}} \right] + \left[\frac{3}{4} \times \text{FY Activity Data}_{\text{Succeeding year}} \right]$$

Equations used for emissions estimates:

The emissions from this category were estimated by applying the Net Calorific Value (fuel type-wise) and corresponding fuel type-wise emission factor to the type of fuel consumed for generating electricity. The equations used for estimations are mentioned below:

$$\text{Emissions}_{\text{Gas}} = \text{Activity Data}_{\text{Fuel}} \times \text{Net Calorific Value}_{\text{Fuel}} \times \text{Emission Factor}_{\text{Gas}}$$

(slightly modified version of IPCC 2006 Equation 2.1)

Emissions in terms of CO₂e (both GWP and GTP) were calculated using the following equations:

$$\text{Emissions}_{\text{CO}_2\text{e}} (\text{GWP}) = \text{Emissions}_{\text{CO}_2} + (\text{GWP}_{\text{CH}_4} \times \text{Emissions}_{\text{CH}_4}) + (\text{GWP}_{\text{N}_2\text{O}} \times \text{Emissions}_{\text{N}_2\text{O}})$$

$$\text{Emissions}_{\text{CO}_2\text{e}} (\text{GTP}) = \text{Emissions}_{\text{CO}_2} + (\text{GTP}_{\text{CH}_4} \times \text{Emissions}_{\text{CH}_4}) + (\text{GTP}_{\text{N}_2\text{O}} \times \text{Emissions}_{\text{N}_2\text{O}})$$

1A1 aii Captive Power Plants

Emissions from the Captive Power Plant category were estimated based on the non-utility power plants.

Methodology:

Estimation of Specific Fuel Consumption:

Specific fuel consumption for Captive Power Plants has been estimated using national estimates as reported in CEA General Review Report. The fuel-wise specific consumption calculations are explained below:

- Specific diesel consumption was estimated from the generation and fuel consumption data of diesel power plants for 2018.⁶
- Since the gas-based power was almost entirely generated from consumption of natural gas, the specific gas consumption was estimated based on natural gas consumption and the corresponding electricity generated.
- For coal/lignite (steam) based generation, year-wise specific fuel consumption was provided in General Review 2021, 2022, 2023 and 2024 for the years 2009-10 to 2022-23.

A mix approach of Tier 1 (T1) and Tier 2 (T2) was used for estimating GHG emissions from the Captive Power Plant category (see Table 6)

Table 6: Type of emissions factor and the level of methodological tier employed for GHG estimation

IPCC ID	GHG Sources and sink categories	CO ₂		CH ₄		N ₂ O	
		Method Applied	Emission Factor	Method Applied	Emission Factor	Method Applied	Emission Factor
1A1 aii	Captive Power Plants	T1, T2	CS	T1	D	T1	D
T1: Tier 1, T2: Tier 2, D: IPCC Default, CS: Country-Specific							

The Net Calorific Value of fuels and emission factors of Carbon dioxide (CO₂) were taken from INCCA Report (2010) and BUR (Biennial Update Report) 2 (2018). The emission factors of Methane (CH₄) and Nitrous Oxide (N₂O) were taken from 2006 IPCC Guidelines. The Density of Diesel and Gas were obtained from the Petroleum Planning and Analysis Cell, (2022) Report. (see Table 7 and Table 8).

⁶ Majority of generation in 2018 was by diesel and not by other petroleum fuels such as LSHS or Diesel oil. Also, the specific diesel consumption may not vary much as the Gross Calorific Value of Diesel, LSHS, LDO and HSD are more or less the same.

Table 7: Emission Factor of Fuels

Fuels	INCCA and BUR 2		IPCC	
	NCV (Tj/kt)	CO ₂ EF (t/TJ)	CH ₄ (kg/TJ)	N ₂ O (kg/TJ)
Non-coking Coal	17.09	96.76	1.00	1.40
Diesel/ Light Diesel Oil (LDO)	43.00	74.10	3.00	0.60
Compressed Natural Gas (CNG)	48.00	56.10	1.00	0.10

Table 8: Density of Fuel used for the emissions estimates

Density of Fuels	Value
Diesel (HSD)	1.21 kL/t
Natural Gas	0.76 kg/scm

Source: Petroleum Planning and Analysis Cell, (2022)

Limitations:

The current emission estimates are based on the generation data of Captive Power Plants above 1 MW as the generation data of Captive Power Plants less than 1MW was not available.

Equations used for emissions estimates:

The equations used for estimations are mentioned below:

$$Emissions_{Gas} = Fuel\text{-}wise\ electricity\ generated \times Specific\ Fuel\ Consumption_{Fuel} \times Net\ Calorific\ Value_{Fuel} \times Emission\ Factor_{Gas} \quad (slightly\ modified\ version\ of\ IPCC\ 2006\ Equation\ 2.1)$$

Emissions in terms of CO₂e (both GWP and GTP) were calculated using the following equations:

$$Emissions_{CO_2e}(GWP) = Emissions_{CO_2} + (GWP_{CH_4} \times Emissions_{CH_4}) + (GWP_{N_2O} \times Emissions_{N_2O})$$

$$Emissions_{CO_2e}(GTP) = Emissions_{CO_2} + (GTP_{CH_4} \times Emissions_{CH_4}) + (GTP_{N_2O} \times Emissions_{N_2O})$$

1A2 Industrial Energy

The emissions from the Industrial Energy sub-sector were estimated for Naphtha, High Speed Diesel (HSD), Light Diesel Oil (LDO), Furnace Oil (FO)/ Low Sulphur Heavy Stock (LSHS) and Natural Gas fuels. The emissions from these fuels have been estimated using the activity data (see Table 1) and the following assumptions

Assumptions:

1. Naphtha:

- a. The Naphtha consumption reported in the study conducted by Pillai, V. & AM Narayanan, (2019) is assumed to be inclusive of the Naphtha consumption accounted under Public Electricity Generation.
- b. For years 2004-05 to 2006-07, the Naphtha consumption was assumed to be the same as the value reported for 2007-08. This was because the derived value using CAGR appeared to be out of proportion.
- c. The final values of Naphtha consumed for industrial usage, for the years 2004-05 to 2021-22 was adjusted based on the Naphtha consumption data already accounted under the Public Electricity Generation category.
- d. For the period 2022-23 and 2023-24, the overall naphtha consumption in industrial energy sub-sector was estimated using the CAGR method
- e. Since the reported/estimated quantity of naphtha for industry usage were miniscule in comparison to other years, and adjusted figures resulted in negative values, naphtha consumption for the years 2016-17, 2017-18, and 2023-24 was considered as zero.

2. High Speed Diesel (HSD):

- a. HSD consumption reported by Pillai, V. & AM Narayanan, (2019) is assumed to be inclusive of the HSD consumption accounted under Public Electricity Generation and Captive Power Plants.
- b. Hence, the final HSD values for industrial usage for the years 2007-08 to 2017-18 was calculated by adjusting the Diesel consumption data accounted under Public Electricity Generation and Captive Power Plants categories.
- c. For the period 2004-05 to 2006-07 and 2018-19 to 2023-24, the High-Speed Diesel consumption data was estimated using the CAGR method.

3. Furnace Oil (FO)/ Low Sulphur Heavy Stock (LSHS)

- a. The FO/LSHS consumption reported by Pillai, V. & AM Narayanan, (2019) is assumed to be inclusive of the LSHS consumption from the Public Electricity Generation category.
- b. Hence, the FO/LSHS consumption for industrial usage for the years 2007-08 to 2017-18 was estimated by adjusting with the LSHS consumption values already accounted under Public Electricity Generation.
- c. For the years 2004-05 to 2006-07 and 2018-19 to 2020-21, the FO/LSHS consumption data was estimated using the CAGR method.

4. **Natural Gas:**

- For the years 2004-05 to 2006-07, the Natural Gas consumption was assumed to be zero considering the values reported in year 2007-08.
- The Natural Gas consumption reported by Pillai, V. & AM Narayanan, (2019) is assumed to include the Natural Gas consumption from Captive Power Plants.
- The consumption data reported by the Pillai, V. & AM Narayanan, (2019) was minuscule between 2013-14 and 2015-16. Thus, the Natural Gas consumption values for industrial use were adjusted only for the period 2016–18 by deducting corresponding values accounted under Captive Power Plant category.
- Since the Natural Gas consumption data was not available for the 2018-19 to 2023-24, an average value of 230.93 kt (based on 2016-17 and 2017-18 estimates) was applied.

Methodology:

Emissions from the Industrial Energy category was estimated using the Tier 1 (T1) and Tier (2) approaches (see Table 9)

Table 9: Type of emissions factor and the level of methodological tier employed for GHG estimation

IPCC ID	GHG Sources and sink categories	CO ₂		CH ₄		N ₂ O	
		Method Applied	Emission Factor	Method Applied	Emission Factor	Method Applied	Emission Factor
1A 2	Industrial Energy	T2	CS	T1	D	T1	D
T1: Tier 1, T2: Tier 2, D: IPCC Default, CS: Country-Specific							

The Net Calorific Value (NCV) of fuels and emission factors of Carbon dioxide (CO₂) were taken from INCCA Report (2010) and the emission factors of Methane (CH₄) and Nitrous Oxide (N₂O) were taken from 2006 IPCC Guidelines. (see Table 10)

Table 10: Emissions Factors of Fuels

Fuels	INCCA		IPCC	
	NCV (Tj/kt)	CO ₂ EF (t/TJ)	CH ₄ (kg/TJ)	N ₂ O (kg/TJ)
Naphtha	43.0	74.1	3	0.6
Diesel	43.0	74.1	3	0.6
Furnace Oil/LSHS	40.4	77.4	3	0.6
Natural Gas	48	56.1	3	0.6

Equations used for emissions estimates:

The emissions from this category were estimated by applying the Net Calorific Value (fuel type-wise) and corresponding fuel type-wise emission factor to the type of fuel consumed. The equations used for estimations are mentioned as follows:

$$Emissions_{Gas} = Activity\ Data_{Fuel} \times Net\ Calorific\ Value_{Fuel} \times Emission\ Factor_{Gas}$$

(slightly modified version of IPCC 2006 Equation 2.1)

Emissions in terms of CO₂e (both GWP and GTP) were calculated using the following equations:

$$Emissions_{CO_2e}(GWP) = Emissions_{CO_2} + (GWP_{CH_4} \times Emissions_{CH_4}) + (GWP_{N_2O} \times Emissions_{N_2O})$$

$$Emissions_{CO_2e}(GTP) = Emissions_{CO_2} + (GTP_{CH_4} \times Emissions_{CH_4}) + (GTP_{N_2O} \times Emissions_{N_2O})$$

Activity data provided in financial year (FY) format was converted to calendar year (CY) format using the following equations:

$$CY\ Activity\ data = [1/4 * FY\ Activity\ Data_{Preceding\ year}] + [3/4 * FY\ Activity\ Data_{Succeeding\ year}]$$

Limitations:

The Industry-wise and Fuel type-wise fuel consumption data were not available for this category; emissions were estimated based on overall fuel consumed in this sub-sector.

1A 3 Transport

The Transport sector emissions cover four different modes of transport viz Aviation, Road Transport, Railways and Water-borne Navigation sub-sector. The Transport sector emissions estimates used a combination of Tier 1 (T1) and Tier 2 (T2) approaches. The activity data for emissions estimation were obtained from Indian Petroleum and Natural Gas statistics (Ministry of Petroleum and Natural Gas); study conducted by Pillai, V. & AM Narayanan, (2019); Southern Railways Department- Indian Railways; Kerala State Water Transport and Kerala Maritime Board. The data sources, methodology, assumptions and emission factor considered for these 4 sub-sectors have been detailed below:

1A3a Civil Aviation

The emissions from this category arise due to combustion of fuels and for current assessment Aviation Turbine Fuel (ATF) was considered for emissions estimates.

Methodology

The GHG emissions were estimated based on the Tier 1 (T1) and Tier (2) approaches (2006 IPCC Guidelines)⁷ (see Table 11).

Table 11: Type of emission factor and the level of methodological tier employed for GHG estimation

IPCC ID	GHG Sources and sink categories	CO ₂		CH ₄		N ₂ O	
		Method Applied	Emission Factor	Method Applied	Emission Factor	Method Applied	Emission Factor
1A3a	Civil Aviation	T1, T2	CS	T1	D	T1	D
T1: Tier 1, T2: Tier 2, D: IPCC Default, CS: Country-Specific							

The Net Calorific Value (NCV) of fuels and emission factors of Carbon dioxide (CO₂) were taken from INCCA Report, (2010) and the emission factors of Methane (CH₄) and Nitrous Oxide (N₂O) were taken from 2006 IPCC Guidelines (see Table 12)

Table 12: Emissions Factors of Fuel

Fuel	INCCA		IPCC	
	NCV (Tj/kt)	CO ₂ EF (t/TJ)	CH ₄ (kg/TJ)	N ₂ O (kg/TJ)
Aviation Turbine Fuel (ATF)	44.10	71.5	0.50	2.00

Equations used for emissions estimates

The emissions from this category is estimated by applying the Net Calorific Value (fuel type-wise) and corresponding fuel type-wise emission factor to the type of fuel consumed. The equations used for estimations are mentioned below:

$$Emissions_{Gas} = Activity Data_{Fuel} \times Net\ Calorific\ Value_{Fuel} \times Emission\ Factor_{Gas}$$

(slightly modified version of IPCC 2006 Equation 2.1)

Emissions in terms of CO₂e (both GWP and GTP) were calculated using the following equations:

$$Emissions_{CO_2e}(GWP) = Emissions_{CO_2} + (GWP_{CH_4} \times Emissions_{CH_4}) + (GWP_{N_2O} \times Emissions_{N_2O})$$

$$Emissions_{CO_2e}(GTP) = Emissions_{CO_2} + (GTP_{CH_4} \times Emissions_{CH_4}) + (GTP_{N_2O} \times Emissions_{N_2O})$$

⁷ Emissions from the aviation category were estimated based on 2006 IPCC Guidelines, since no refinements were made in 2019 IPCC Guidelines.

1A3b Road Transport

Emissions from the Road Transport category are estimated for fuels such as Compressed Natural Gas (CNG), Auto LPG, Motor Spirit/Petrol and High-Speed Diesel Oil (HSDO). The following steps and assumptions have been used for estimating the emissions from Road Transport sector:

1. Compressed Natural Gas (CNG):

Assumptions:

- i. CNG sales data of Kerala (reported in Indian Petroleum and Natural Gas statistics) is considered as consumption activity data solely for road transport.
- ii. For the years 2005-16, the CNG sales data for the state of Kerala was not available from Indian Petroleum and Natural Gas Statistics. Therefore, CNG consumption for the said period has been assumed to be zero.

(2) Auto LPG:

Assumptions:

- i. For the years 2004-05 to 2006-07, the Auto LPG consumption data was assumed to be Zero considering the values reported in the year 2007-08.
- ii. The Auto LPG consumption data for the years between 2018-19 to 2023-24 was calculated using the CGAR method.

(3) Motor Spirit/ Petrol:

a. Steps followed to estimate state's Motor Spirit consumption activity data:

- i. The national-level percentage share of Motor Spirit consumption in the retail sector was calculated for the period 2012-13 to 2023-24 using Indian Petroleum and Natural Gas Statistics (MoPNG).
- ii. This estimated percentage share (nation-level) of Motor spirit consumption in retail sector and the percentage share of Petrol-Retail consumption data in Kerala's road transport sector (*as published in PPAC 2013 report*) was then applied to the Motor Spirit consumption data of Kerala to derive consumption data in Kerala's Road transport sector.

Scope for improvement: *The estimations can be refined if the year-on-year percentage share of fuels consumed in transport and retail sectors at national level is replaced with their state-level equivalence.*

b. Assumptions:

- i. The percentage share of Petrol-Retail consumption data of year 2012-13 was applied for years between 2004-05 to 2021-22, due to unavailability of data for any other year in the evaluation period.
- ii. Since the National-level Motor Spirit consumption data in retail sector was not published in Indian Petroleum and Natural Gas Statistics for the period 2004-05 to 2011-12, the percentage share (national-level) of Motor Spirit consumption in retail sector of year 2012-13 was used to calculate Kerala's Motor Spirit consumption in road transport sector for the said period.

4. High Speed Diesel Oil (HSDO):

a. Steps followed to estimate state's HSDO consumption activity data:

- i. The percentage share of HSDO consumption in the Road transport and in Retail sector at national level was calculated for the period 2004-05 to 2023-24.
- ii. The national level percentage share in Road transport was applied to HSDO consumption data of Kerala to derive the consumption data in Kerala's Road transport sector.
- iii. The national level percentage share in Retail sector and the end-use percentage share of Diesel in retail *[as published in PPAC 2013 and 2021 report]* were applied to HSDO consumption data of Kerala to derive the consumption data in Kerala's retail sector.
- iv. The percentage share of HSDO consumption by the private sales sector at national level was calculated for the years 2004-05 to 2006-07.
- v. This percentage share (national level) of the private sales sector was then applied to the HSDO consumption data of Kerala to derive the consumption data by private sales sector in Kerala for the period 2004-05 to 2006-07.
- vi. The total HSDO consumption in Road transport was calculated by adding HSDO consumption data by private sales sector and from road transport and retail sector.

Scope for improvements: *The estimations can be refined if year-on-year percentage share of fuels consumed in transport and retail sectors at national level is replaced with their state-level equivalence.*

b. Assumptions:

Since fuel sales through retail stream was not provided in the MoPNG's Indian Petroleum and Natural Gas Statistics for the years 2004-05 to 2009-10, sales reported under Miscellaneous category were used, assuming it includes retail sales as well. However, for the years 2010-11 to 2021-22, retail sales of fuel were separately reported in the Indian Petroleum and Natural Gas Statistics, and was thus used as one of the activity data.

c. Limitations:

- i. The HSDO consumption data by Private sales sector was not available for the period 2007-08 to 2023-24 from Indian Petroleum and Natural Gas statistics
- ii. The HSDO consumption data by the Private imports sector (reported in Indian Petroleum and Natural Gas Statistics) were negligible, and hence was not considered for emissions estimations.

Methodology:

A combination of Tier 1 (T1) and Tier 2 (T2) approaches were used for emissions estimation (see Table 13)

Table 13: Type of emissions factor and the level of methodological tier employed for GHG estimation

IPCC ID	GHG Sources and sink categories	CO ₂		CH ₄		N ₂ O	
		Method Applied	Emission Factor	Method Applied	Emission Factor	Method Applied	Emission Factor
1A3b	Road Transport	T1, T2	CS	T1	D	T1	D
T1: Tier 1, T2: Tier 2, D: IPCC Default, CS: Country-Specific							

The Net Calorific Value (NCV) of fuels and emission factors of Carbon dioxide (CO₂) were taken from INCCA Report, (2010) and the emission factors of Methane (CH₄) and Nitrous Oxide (N₂O) were taken from 2006 IPCC Guidelines (see Table 14)

Table 14: Emissions Factors of Fuels

Fuels	INCCA		IPCC	
	NCV (Tj/kt)	CO ₂ EF (t/TJ)	CH ₄ (kg/TJ)	N ₂ O (kg/TJ)
Diesel	43.00	74.10	3.90	3.90
Compressed Natural Gas (CNG)	48.00	56.10	92.00	3.00
Liquified Petroleum Gas (LPG)	47.30	63.10	62.00	0.20
Gasoline	44.30	69.30	33.00	3.20

Equations used for emissions estimates

The emissions from this category are estimated by applying the Net Calorific Value (fuel type-wise) and corresponding fuel type-wise emission factor to the type of fuel consumed. The equations used for estimations are mentioned below:

$$Emissions_{Gas} = Activity Data_{Fuel} \times Net\ Calorific\ Value_{Fuel} \times Emission\ Factor_{Gas}$$

(slightly modified version of IPCC 2006 Equation 2.1)

Emissions in terms of CO₂e (both GWP and GTP) were calculated using the following equations:

$$\text{Emissions}_{\text{CO}_2\text{e}} (\text{GWP}) = \text{Emissions}_{\text{CO}_2} + (\text{GWP}_{\text{CH}_4} \times \text{Emissions}_{\text{CH}_4}) + (\text{GWP}_{\text{N}_2\text{O}} \times \text{Emissions}_{\text{N}_2\text{O}})$$

$$\text{Emissions}_{\text{CO}_2\text{e}} (\text{GTP}) = \text{Emissions}_{\text{CO}_2} + (\text{GTP}_{\text{CH}_4} \times \text{Emissions}_{\text{CH}_4}) + (\text{GTP}_{\text{N}_2\text{O}} \times \text{Emissions}_{\text{N}_2\text{O}})$$

1A3c Railways

The emissions of Railways category were estimated for the High-Speed Diesel Oil (HSDO) and Light Diesel Oil (LDO) fuels and have been provided below:

Methodology

The Railways category's emissions were estimated using the Tier 1 (T1) and Tier (2) approaches for fuels such as High-Speed Diesel Oil (HSDO) and Light Diesel Oil (LDO) as provided in Table 15

Table 15: Type of emissions factor and the level of methodological tier employed for GHG estimation

IPCC ID	GHG Sources and sink categories	CO ₂		CH ₄		N ₂ O	
		Method Applied	Emission Factor	Method Applied	Emission Factor	Method Applied	Emission Factor
1A3c	Railways	T1, T2	CS	T1	D	T1	D
T1: Tier 1, T2: Tier 2, D: IPCC Default, CS: Country-Specific							

The Net Calorific Value (NCV) of fuels and emission factors of Carbon dioxide (CO₂) of Diesel and LDO were taken from INCCA Report (2010) and the emission factors of Methane (CH₄) and Nitrous Oxide (N₂O) were taken from 2006 IPCC Guidelines (see Table 16)

Table 16: Emissions Factors of Fuels

Fuels	INCCA		IPCC	
	NCV (Tj/kt)	CO ₂ EF (t/TJ)	CH ₄ (kg/TJ)	N ₂ O (kg/TJ)
Diesel	43.00	74.10	4.15	28.60
Light Diesel Oil (LDO) ⁸	43.00	74.10	10	0.6

⁸ Factors for LDO were taken from IPCC methodology note for Road Transportation as the section on Locomotives had only values available for Diesel

Equations used for emissions estimates

The emissions from this category are estimated by applying the Net Calorific Value (fuel type-wise) and corresponding fuel type-wise emission factor to the type of fuel consumed. The equations used for estimations are mentioned below:

$$Emissions_{Gas} = Activity\ Data_{Fuel} \times Net\ Calorific\ Value_{Fuel} \times Emission\ Factor_{Gas}$$

(slightly modified version of IPCC 2006 Equation 2.1)

Emissions in terms of CO₂e (both GWP and GTP)* were calculated using the following equations:

$$Emissions_{CO_2e} (GWP) = Emissions_{CO_2} + (GWP_{CH_4} \times Emissions_{CH_4}) + (GWP_{N_2O} \times Emissions_{N_2O})$$

$$Emissions_{CO_2e} (GTP) = Emissions_{CO_2} + (GTP_{CH_4} \times Emissions_{CH_4}) + (GTP_{N_2O} \times Emissions_{N_2O})$$

1A3d Water-borne Navigation

The emissions from this category were estimated for Diesel and Petrol fuels. The activity data for emission estimation were sourced from Kerala Maritime Board and State Water Transport Department.

Methodology

1. Source- Kerala Maritime Board

- a. Vessel type-wise registration and fuel consumption data were obtained from the Kerala Maritime Board for the years 2010 to 2022.
- b. Diesel and Petrol fuel consumption data of Inland Vessels were estimated for the years 2010 to 2022 by applying the thumb-rules provided by Kerala Maritime Board-Govt. of Kerala.
- c. The thumb-rules include vessel type-wise average hourly fuel consumption and vessel type-wise average annual operational hours.
- d. The vessel type-wise Diesel fuel consumption data for years 2005 to 2009 and 2023 was estimated using the CAGR method.
- e. The Petrol consumption data was estimated for the years 2005 to 2009 and 2023 using the CAGR method.

Limitation:

In the absence of year-on-year active/live vessels, the cumulative number of registered vessels were considered to be in operation for each year of the evaluation period, starting from 2010, the year since when the fleet data was available.

2. Source- State Water Transport Department

High Speed Diesel (HSD) fuel consumption data was estimated between 2005 and 2023 using thumb-rules provided by the State Water Transport Department – Govt. of Kerala.

- Thumb-rules include fuel-wise average number of boats in operation, average operation hours per day, number of days in operation in a year and average fuel consumption per hour.
- The thumb-rules to estimate HSD fuel consumption was considered to be same from 2005 to 2023 due to unavailability of other supporting data.

3. Estimation of Total Diesel fuel consumption activity data for years 2005 to 2023

- The total diesel fuel consumption activity data for years 2005 to 2023 was calculated by adding the diesel consumed through above two sources.
- For the years 2005 to 2009, the total diesel consumption was calculated using the CAGR method.

Emissions from Diesel and Petrol fuels consumption were estimated for the Water-borne Navigation sub-sector using the Tier 1 (T1) and Tier 2 (T2) approaches (see Table 17).

Table 17: Type of emissions factor and the level of methodological tier employed for GHG estimation

IPCC ID	GHG Sources and sink categories	CO ₂		CH ₄		N ₂ O	
		Method Applied	Emission Factor	Method Applied	Emission Factor	Method Applied	Emission Factor
1A3d	Water-borne Navigation	T1, T2	CS	T1	D	T1	D
T1: Tier 1, T2: Tier 2, D: IPCC Default, CS: Country-Specific							

The Net Calorific Value of fuels and emission factors of Carbon dioxide (CO₂) of Diesel and Petrol fuels were taken from INCCA Report (2010). Emission factors of Methane (CH₄) and Nitrous Oxide (N₂O) for Diesel and Petrol fuel were taken from 2006 IPCC Guidelines. Density of Diesel and Petrol fuels were obtained from PPAC Report, (2022) (see Table 18 and Table 19).

Table 18: Emissions Factors of Fuels

Fuels	INCCA		IPCC ⁹	
	NCV (Tj/kt)	CO ₂ EF (t/TJ)	CH ₄ (kg/TJ)	N ₂ O (kg/TJ)
Diesel /High Speed Diesel	43	74.1	3.9	3.9
Petrol	44.3	69.3	33	3.2

Table 19: Density of Fuel used for the emissions estimates

Density of Fuels	Value
Diesel (HSD)	1.210 kL/t
Petrol	1.411 kL/t

Source: Petroleum Planning and Analysis Cell, (2022)

Equations used for emissions estimates

The emissions from this category are estimated by applying the Net Calorific Value (fuel type-wise) and corresponding fuel type-wise emission factor to the type of fuel consumed.

The equations used for estimations are mentioned below:

$$Emissions_{Gas} = Activity Data_{Fuel} \times Net\ Calorific\ Value_{Fuel} \times Emission\ Factor_{Gas}$$

(slightly modified version of IPCC 2006 Equation 2.1)

Emissions in terms of CO₂e (both GWP and GTP) were calculated using the following equations:

$$Emissions_{CO_2e} (GWP) = Emissions_{CO_2} + (GWP_{CH_4} \times Emissions_{CH_4}) + (GWP_{N_2O} \times Emissions_{N_2O})$$

$$Emissions_{CO_2e} (GTP) = Emissions_{CO_2} + (GTP_{CH_4} \times Emissions_{CH_4}) + (GTP_{N_2O} \times Emissions_{N_2O})$$

The activity data of Aviation Turbine Fuel provided in financial year (FY) format was converted to calendar year (CY) format using the following equations for emissions estimations (2005 to 2023):

$$CY\ Activity\ data = [1/4 * FY\ Activity\ Data_{Preceding\ year}] + [3/4 * FY\ Activity\ Data_{Succeeding\ year}]$$

⁹ The emissions factor of Methane (CH₄) and Nitrous oxide (N₂O) for Diesel and Petrol fuels is assumed to be the same as that of Road Transport due to unavailability of emission factors specific to water-borne navigation

1A4 Other Sectors (Energy)

The Other Sectors (Energy) consist of three sub-sectors, viz. Commercial, Residential and Agriculture/Fisheries. The emissions from this sector arise due to combustion of fuels used for various activities. Emissions from this sector have been estimated using the Tier 1 (T1) and Tier 2 (T2) approaches. The activity data for Other Sectors' emissions estimates were obtained and calculated using Indian Petroleum and Natural Gas statistics (Ministry of Petroleum and Natural Gas); Centre for Development Study Report, Kerala and Economic Review Reports (State Planning Board-Govt of Kerala). The data sources, methodology and assumption used for emission estimations have been outlined below:

1A4a Commercial/Institutional

Liquified Petroleum Gas (LPG) and High-Speed Diesel Oil (HSDO) were the fuels for which emissions were estimated under the Commercial sub-sector. The following steps/assumptions were used for estimating the emissions in Commercial sector:

1. Liquified Petroleum Gas (LPG):

Steps followed to estimate LPG consumption activity data:

- i. The percentage share of LPG consumption by the commercial sector at national level was calculated for the years 2004-05 to 2023-24 using the Indian Petroleum and Natural Gas Statistics reports (MoPNG).
- ii. This estimated national-level percentage share was then applied to the state's overall LPG consumption data to estimate state's LPG consumption at commercial level, for the period 2004-05 to 2023-24
- iii. The derived LPG consumption data was in financial years which was converted into calendar years format using the following equations (2005 to 2021):

$$\text{CY Activity data} = \left[\frac{1}{4} * \text{FY Activity Data}_{\text{Preceding year}} \right] + \left[\frac{3}{4} * \text{FY Activity Data}_{\text{Succeeding year}} \right]$$

Scope for improvement: *The estimations can be refined if year-on-year percentage share of fuels consumed in the commercial sector at national level is replaced with their state-level equivalent.*

2. High Speed Diesel Oil (HSDO) :

a. Steps followed to estimate HSDO consumption activity data of years 2020-21 to 2023-24:

- The percentage share of Diesel consumption by commercial sector¹⁰ [as published in PPAC report 2021]
- The estimated percentage share was applied to national-level HSDO consumption data by retail sector to estimate the state's retail sector consumption data (Percentage share of Diesel in Non-Transport sector data were applied for the years 2020-21 and 2023-24).
- The estimated total HSDO consumption data in financial years was converted into calendar years format using the following equations (2005 to 2023):

$$\text{CY Activity data} = \left[\frac{1}{4} * \text{FY Activity Data}_{\text{Preceding year}} \right] + \left[\frac{3}{4} * \text{FY Activity Data}_{\text{Succeeding year}} \right]$$

Scope for improvement: The estimations can be refined if 2020-21 and 2023-24's percentage share of fuels consumed in retail and commercial sectors at national level is replaced with their corresponding state-level values.

Methodology:

The Tier 1 (T 1) and Tier 2 (T2) approaches were used to estimate emissions from the Commercial category (see Table 20)

Table 20: Type of emissions factor and the level of methodological tier employed for GHG estimation

IPCC ID	GHG Sources and sink categories	CO ₂		CH ₄		N ₂ O	
		Method Applied	Emission Factor	Method Applied	Emission Factor	Method Applied	Emission Factor
1A4a	Commercial	T1, T2	CS	T1	D	T1	D
T1: Tier 1, T2: Tier 2, D: IPCC Default, CS: Country-Specific							

The Net Calorific Value (NCV) and Carbon dioxide (CO₂) emission factors of fuels were taken from INCCA Report (2010). Emission factors of Methane (CH₄) and Nitrous Oxide (N₂O) for Diesel and LPG fuels were taken from 2006 IPCC Guidelines. The state- level Diesel consumption data of commercial sector for the year 2020-21 was taken from the PPAC Report (2021) (see Table 21, Table 22 and Table 23).

¹⁰ The commercial sector includes Gensets and Others (include Mobile Tower and other segments).

Table 21: Emissions Factors of Fuels

Fuel	INCCA		IPCC	
	NCV (Tj/kt)	CO ₂ EF (t/TJ)	CH ₄ (kg/TJ)	N ₂ O (kg/TJ)
Diesel	43	74.1	10	0.6
Liquified Petroleum Gas (LPG)	47.3	63.1	5	0.1

Table 22: Estimated State-level Diesel-retail consumption of commercial sector

Parameter	2020-21
DG set	0.05
Others (include Mobile Tower and other segments)	0.142
Total	0.146

Source: PPAC Report, 2021

Equations used for emissions estimates

The emissions from this category is estimated by applying the Net Calorific Value (fuel type-wise) and corresponding fuel type-wise emission factor to the type of fuel consumed. The equations used for estimations are mentioned below:

$$Emissions_{Gas} = Activity Data_{Fuel} \times Net\ Calorific\ Value_{Fuel} \times Emission\ Factor_{Gas}$$

(slightly modified version of IPCC 2006 Equation 2.1)

Emissions in terms of CO₂e (both GWP and GTP) were calculated using the following equations:

$$Emissions_{CO_2e} (GWP) = Emissions_{CO_2} + (GWP_{CH_4} \times Emissions_{CH_4}) + (GWP_{N_2O} \times Emissions_{N_2O})$$

$$Emissions_{CO_2e} (GTP) = Emissions_{CO_2} + (GTP_{CH_4} \times Emissions_{CH_4}) + (GTP_{N_2O} \times Emissions_{N_2O})$$

1A4b Residential

The emissions from Kerosene and Liquified Petroleum Gas (LPG) fuels were estimated for the Residential category. The following assumptions and steps were used for estimating the emissions from the Residential sector:

1. Kerosene:

- a. Kerosene consumption data for the residential sector of Kerala were obtained for the years 2007-08 to 2017-18 from the study conducted by Pillai N, V., Am, N. (2019).

- b. For the years 2004-05 to 2006-07 and 2018-19 to 2021-22, the quantity of Kerosene consumption in the residential sector was calculated by applying its average consumption in the state for domestic usage to the overall consumption of Kerosene in the state.
- i. The average percentage share (60%) of Kerosene consumption of Domestic usage in the state was calculated from the study conducted by Pillai N, V., Am, N. (2019).
 - ii. The overall consumption of Kerosene in the state was obtained from Economic Review Reports of Kerala.

2. Liquified Petroleum Gas (LPG):

Steps followed to estimate LPG consumption activity data of years 2004-05 to 2006-07 and 2018-19 to 2021-22

- i. The percentage share of LPG consumption by domestic sector at national level was calculated for the period 2004-05 to 2006-07 and 2018-19 to 2023-24.
- ii. The national level percentage share by domestic sector was then applied to the state's total LPG consumption data to derive residential sector consumption data.
- iii. The percentage share of LPG consumption by private sales sector at national level was calculated for the year 2004-05 to 2006-07.
- iv. This percentage share (national level) of private sales sector was then applied to the LPG consumption data of Kerala to derive the consumption data by private sales sector in Kerala for the period 2004-05 to 2006-07.
- v. The total LPG consumption in Residential sector was calculated by summing up LPG consumption data of private sales and domestic sector.

Methodology

The Tier 1 (T1) and Tier 2 (T2) approaches were used to estimate emissions from the Residential category (see Table 23)

Table 23: Type of emissions factor and the level of methodological tier employed for GHG estimation

IPCC ID	GHG Sources and sink categories	CO ₂		CH ₄		N ₂ O	
		Method Applied	Emission Factor	Method Applied	Emission Factor	Method Applied	Emission Factor
1A4b	Residential	T1, T2	CS	T1	D	T1	D
T1: Tier 1, T2: Tier 2, D: IPCC Default, CS: Country-Specific							

The Net Calorific Value (NCV) and Carbon dioxide (CO₂) emission factors of fuels were taken from INCCA Report (2010). Emission factors of Methane (CH₄) and Nitrous Oxide (N₂O) for Kerosene and LPG fuels were taken from 2006 IPCC Guidelines (see Table 24)

Table 24: Emissions Factors of Fuels

Fuels	INCCA		IPCC	
	NCV (Tj/kt)	CO ₂ EF (t/TJ)	CH ₄ (kg/TJ)	N ₂ O (kg/TJ)
Kerosene	43.8	71.9	10	0.6
Liquified Petroleum Gas (LPG)	47.30	63.10	5	0.1

Equations used for emissions estimates:

The emissions from this category is estimated by applying the Net Calorific Value (fuel type-wise) and corresponding fuel type-wise emission factor to the type of fuel consumed. The equations used for estimations are mentioned below:

$$Emissions_{Gas} = Activity Data_{Fuel} \times Net\ Calorific\ Value_{Fuel} \times Emission\ Factor_{Gas}$$

(slightly modified version of IPCC 2006 Equation 2.1)

Emissions in terms of CO₂e (both GWP and GTP) were calculated using the following equations:

$$Emissions_{CO_2e} (GWP) = Emissions_{CO_2} + (GWP_{CH_4} \times Emissions_{CH_4}) + (GWP_{N_2O} \times Emissions_{N_2O})$$

$$Emissions_{CO_2e} (GTP) = Emissions_{CO_2} + (GTP_{CH_4} \times Emissions_{CH_4}) + (GTP_{N_2O} \times Emissions_{N_2O})$$

Activity data provided in financial year (FY) format was converted to calendar year (CY) format using the following equations:

$$CY\ Activity\ data = [1/4 * FY\ Activity\ Data_{Preceding\ year}] + [3/4 * FY\ Activity\ Data_{Succeeding\ year}]$$

1A4c Agriculture Energy

For current assessment, the emissions from Agriculture category have been estimated only for Diesel fuel, due to unavailability of other fuels consumption data. The activity data for this category were taken from Indian Petroleum and Natural Gas Statistics (MoPNG) and the have been detailed below:

1. Diesel/ High Speed Diesel Oil:

a. Steps followed to estimate consumption activity data:

- i. The percentage share of HSDO consumption in Agriculture sector and in the Retail sector at national level was calculated for the period 2004-05 to 2023-24 using Indian Petroleum and Natural Gas Statistics (MoPNG).
- ii. The national level percentage share in the Agriculture sector was applied to HSDO consumption data of Kerala to derive consumption data in the agriculture sector.
- iii. The percentage share of Diesel consumption in Non-Transport (agriculture) sector¹¹ of Kerala in retail *[as published in PPAC reports - 2013 and 2021]* was calculated for the period 2012-13 and 2020-21
- iv. The national level percentage share in retail sector and state's percentage share of Diesel consumption in agriculture sector in for the period 2012-13 were applied to HSDO consumption data of Kerala to estimate the state's retail sector consumption data
(Percentage share of Diesel in agriculture sector data were applied for the years 2004-05 to 2019-20)
- v. For the year 2020-21 to 2023-24, the estimated state's percentage share of diesel consumption in agriculture sector in retail for the period 2020-21 was applied to the national-level HSDO consumption in retail sector to estimate Kerala's diesel consumption in agriculture sector in retail sector.
- vi. The estimated HSDO consumption data (*Agriculture and Retail sectors*) in financial years were converted into calendar years format using the following equations (2005 to 2023):

$$\text{CY Activity data} = \left[\frac{1}{4} * \text{FY Activity Data}_{\text{Preceding year}} \right] + \left[\frac{3}{4} * \text{FY Activity Data}_{\text{Succeeding year}} \right]$$

b. Assumptions:

- i. Since fuel sales through retail stream was not provided in the MoPNG's Indian Petroleum and Natural Gas Statistics for the years 2004-05 to 2009-10, sales reported under Miscellaneous category were used, assuming it includes retail sales as well. However, for the years 2010-11 to 2023-4, retail sales of fuel were separately reported in the Indian Petroleum and Natural Gas Statistics, and was thus used as one of the activity data.

¹¹ The Non- Transport sector includes the Tractors, Agri Implements and Agri pump sets

- ii. The percentage share of Diesel consumption data in the Non-Transport (agriculture) sector of Kerala was obtained for the years 2012-13 and 2021-22 from All India study on sectoral demand of Diesel and Petrol Reports (PPAC) 2013 and 2021.
- Percentage share of Diesel in Non-Transport sector data was applied in following format: The 2012-13 data was applied for the years 2004-05 to 2019-20 and 2020-21 data was applied for the years 2020-21 to 2023-24.

Methodology:

For the Agriculture category, Tier 1 (T1) and Tier 2 (T2) approaches has been used for emission estimations (see Table 25)

Table 25: Type of emissions factor and the level of methodological tier employed for GHG estimation

IPCC ID	GHG Sources and sink categories	CO ₂		CH ₄		N ₂ O	
		Method Applied	Emission Factor	Method Applied	Emission Factor	Method Applied	Emission Factor

Source: PPAC, 2021

Equations used for emissions estimates

The emissions from this category is estimated by applying the Net Calorific Value (fuel type-wise) and corresponding fuel type-wise emission factor to the type of fuel consumed. The equations used for estimations are mentioned below:

$$Emissions_{Gas} = Activity Data_{Fuel} \times Net\ Calorific\ Value_{Fuel} \times Emission\ Factor_{Gas}$$

(slightly modified version of IPCC 2006 Equation 2.1)

Emissions in terms of CO₂e (both GWP and GTP) were calculated using the following equations:

$$Emissions_{CO_2e} (GWP) = Emissions_{CO_2} + (GWP_{CH_4} \times Emissions_{CH_4}) + (GWP_{N_2O} \times Emissions_{N_2O})$$

$$Emissions_{CO_2e} (GTP) = Emissions_{CO_2} + (GTP_{CH_4} \times Emissions_{CH_4}) + (GTP_{N_2O} \times Emissions_{N_2O})$$

1A4c Fisheries

The emissions from Kerosene Diesel and Petrol fuels were estimated for the Fisheries category using the following thumb-rules, equations and assumptions

1. Kerosene

Equations used for estimating Diesel fuel consumption data

$$Emissions_{Gas} = Activity\ Data_{Fuel} \times Net\ Calorific\ Value_{Fuel} \times Emission\ Factor_{Gas}$$

2. Diesel

a. Thumb-rules followed:

- i. The thumb-rules to estimate Diesel fuel consumption was directly obtained from the Fisheries Department-Govt. of Kerala for the years 2005 to 2022.
- ii. The thumb-rules contain:
 - Fuel consumption and operations data comprising Fuel type-wise craft, engine type and horsepower of craft; average fuel consumption (Liters/hour and Liters/Trip) and average trip/month data.
 - The number of active months of fishing in the state was taken based on the inputs received from the Fisheries Department-Govt of Kerala.
- iii. Craft type-wise and fuel type-wise fleet registration (*ReALCRaft*) data was directly obtained from Fisheries Department-Govt. of Kerala for the years 2005 to 2023.

b. Equations used for estimating Diesel fuel consumption data for years 2008 to 2021

$$\text{Fuel consumed} = \text{Fleet Stock}_{(craft-based)} \times \text{Average Fuel consumption}_{(Trips/Month)} \times \text{Months of Active Fishing}$$

c. Assumptions:

- i. Based on the availability of reliable data, the diesel fuel consumption data was estimated only for the period 2008 to 2022
- ii. For years 2005, 2006 and 2007 and 2023 the diesel consumption data was estimated using the CAGR method.
- iii. The average diesel consumed (Trips/Month) was calculated based on the thumb-rules provided for Total Motorised Mechanical craft, since the category-wise fleet stock data for Motorised Mechanical craft (Trawlers, Thanguvallam and Gill netters) were not provided.

3. Petrol:

a. Thumb-rules followed:

- i. The thumb-rules to estimate Petrol fuel consumption was directly obtained from the Fisheries Department-Govt. of Kerala for the years 2005 to 2022. The thumb-rules contain:

- Fuel consumption and operations data comprising Fuel type-wise craft, engine type and horsepower of craft; average fuel consumption (Liters/hour and Liters/Trip) and average trip/month data.
 - The number of active months of fishing in the state was taken based on the inputs received from the Fisheries Department-Govt of Kerala.
- ii. Craft type-wise and fuel type-wise fleet registration (*ReALCRaft*) data was directly obtained from Fisheries Department-Govt. of Kerala for the years 2005 to 2022.

b. Equations used for estimating Petrol fuel consumption data for years 2008 to 2021

Fuel consumed= Fleet Stock *(craft-based)* x Average Fuel consumption (Liters/Trip) *Lowest HP of engine* x Average Trip/Month *Lowest HP of engine* x Months of Active Fishing

c. Assumptions:

- Based on the availability of reliable data, the diesel fuel consumption data was estimated only for the period 2008 to 2022.
- For years 2005,2006 and 2007, and 2023 the petrol consumption data was estimated using the CAGR method.
- The Average fuel consumption (Liters/Trip) and Average Trip/Month data of crafts with lowest HP of engine (*provided in the thumb-rules*) were considered for calculations based on inputs received from the Fisheries department.

Scope for Improvement:

The Diesel and Petrol fuel consumption data for the entire evaluation period can be refined if fuel sold data is provided by Matsyafed.

Methodology:

The emissions from the Fisheries category were estimated using Tier 1 (T1) and Tier 2 (T2) approaches (see Table 28)

Table 28: Type of emissions factor and the level of methodological tier employed for GHG estimation

IPC C ID	GHG Sources and sink categories	CO ₂		CH ₄		N ₂ O	
		Method Applied	Emission Factor	Method Applied	Emission Factor	Method Applied	Emission Factor
1A4c	Fisheries	T1, T2	CS	T1	D	T1	D
T1: Tier 1, T2: Tier 2, D: IPCC Default, CS: Country-Specific							

The Net Calorific Value (NCV) and Carbon dioxide (CO₂) emission factors of fuels were taken from INCCA Report (2010). Emission factors of Methane (CH₄) and Nitrous Oxide (N₂O) for Diesel were taken from 2006 IPCC Guidelines. Density of Diesel and Petrol were obtained from PPAC (2022) Report and the data on the estimated number of active months of fishing was taken based on the inputs received from the Fisheries Department- Govt. of Kerala (see Table 29, Table 30 and Table 31).

Table 29: Emissions Factors of Fuels

Fuels [#]	INCCA		IPCC	
	NCV (Tj/kt)	CO ₂ EF (t/TJ)	CH ₄ (kg/TJ)	N ₂ O (kg/TJ)
Diesel	43.00	74.1	33	3.2
Kerosene	43.8	71.9	10	0.6
Petrol	44.3	69.3	3.9	3.9

[#]

Note: The Fisheries sub-sector is considered under mobile combustion.

(a) For Diesel and Petrol fuels, emission factors of Methane (CH₄) and Nitrous Oxide (N₂O) were not available for fishing-mobile combustion in IPCC guidelines. Therefore, the emission factor was assumed to be the same as that of Road transportation.

(b) Due to unavailability of Methane (CH₄) and Nitrous Oxide (N₂O) emission factors for Kerosene specific to fishing-mobile combustion activity, corresponding proxy factors from fishing-stationary combustion were used.

Table 30: Density of Fuel used for the emissions estimates

Density of Fuel	Value
Diesel	1.210 kL/t
Petrol	1.411 kL/t

Source: Petroleum Planning and Analysis Cell, (2022)

Table 31: Number of active months of Fishing in the state

Parameter	Data
Estimated no. of active months of fishing	10

Equations used for emissions estimates

Emissions in terms of CO₂e (both GWP and GTP) were calculated using the following equations:

$$\text{Emissions}_{\text{CO}_2\text{e}} (\text{GWP}) = \text{Emissions}_{\text{CO}_2} + (\text{GWP}_{\text{CH}_4} \times \text{Emissions}_{\text{CH}_4}) + (\text{GWP}_{\text{N}_2\text{O}} \times \text{Emissions}_{\text{N}_2\text{O}})$$

$$\text{Emissions}_{\text{CO}_2\text{e}} (\text{GTP}) = \text{Emissions}_{\text{CO}_2} + (\text{GTP}_{\text{CH}_4} \times \text{Emissions}_{\text{CH}_4}) + (\text{GTP}_{\text{N}_2\text{O}} \times \text{Emissions}_{\text{N}_2\text{O}})$$

1B Fugitive Emissions from Fuels

Fugitive emissions arise from various activities in fossil fuel production at mines and wells, where coal, oil, and natural gas are produced (Mohan, R.R, 2019). However, in Kerala, BPCL Kochi Refinery was the only source identified for the fugitive emissions.

Methodology

The current assessment uses the Tier 2 method to estimate the Methane (CH₄) emissions from the refinery's crude throughput (see Table 32). The country-specific emission factor of refinery Throughput was obtained from the INCCA (2010) report (see Table 33).

Table 32: Type of emissions factor and the level of methodological tier employed for GHG estimation

IPCC ID	GHG Sources and sink categories	CO ₂		CH ₄		N ₂ O	
		Method Applied	Emission Factor	Method Applied	Emission Factor	Method Applied	Emission Factor
1B	Fugitive Emissions	-	-	T2	CS	-	-
T2: Tier 2, CS: Country-Specific							

Table 33: Emission Factors used for Methane (CH₄) estimation

Parameter	Emission Factor (INCAA)	Emission Factor used
Refinery Throughput	6.75904 x 10 ⁻⁵ Gg / million tons	0.0675904 tons/Mt

Note: Gg refer to Gigagrams

Equations used for emissions estimates

The equation used for estimating Fugitive Emissions are as below:

$$Emissions_{Gas} = Refinery\ Throughput \times Emission\ Factor_{Gas}$$

Emissions in terms of CO₂e (both GWP and GTP) were calculated using the following equations:

$$Emissions_{CO_2e} (GWP) = Emissions_{CH_4} \times GWP_{CH_4}$$

$$Emissions_{CO_2e} (GTP) = Emissions_{CH_4} \times GTP_{CH_4}$$

Pillai, V. & AM Narayanan. (2019). Energy Efficiency: A Sectoral Analysis for Kerala. In *Centre for Development Studies*.
https://mpa.ub.uni-muenchen.de/101424/1/MPRA_paper_101424.pdf

INDUSTRIAL PROCESSES AND PRODUCT USE (IPPU) SECTOR

Key Highlights

- In Kerala, the IPPU sector represented 5.7 % of the gross GHG emissions (excluding LULUCF) in 2023.
- The total IPPU emissions remained same as 1.47 Mt CO₂e in 2005 and 2023
- Within IPPU emissions, almost 49% of emissions emanated from ammonia production in 2023. This was followed by emissions from carbon black (~19 %) and cement (~12%).

Figure 2: GHG Emissions Estimates of IPPU Sector – Kerala (2005 to 2023)

Sector Description

The category of Industrial Processes and Product Use (IPPU) encompasses emissions of greenhouse gases resulting from industrial processes, the utilization of greenhouse gases in products, and non-energy applications of fossil fuel carbon. Greenhouse gas emissions stem from a diverse array of industrial activities, with primary sources being the release of gases during processes that chemically or physically transform materials. These processes can yield various greenhouse gases, including carbon dioxide (CO₂), methane (CH₄), nitrous oxide (N₂O), hydrofluorocarbons (HFCs), and perfluorocarbons (PFCs) (IPCC, 2006).

The key economic sectors/categories included in the emission estimates are

- 2A: Mineral Industry
 - 2A1 Cement production
 - 2A2 Lime production
 - 2A4b Other Uses of Soda ash
- 2B Chemical Industry
 - 2B1 Ammonia Production

- 2B4 Caprolactam Production
- 2B6 Titanium Dioxide Production
- 2B7 Soda ash Production
- 2B8f Carbon Black
- 2C Metal Industry
 - 2C1 Iron and Steel Production
 - 2C6 Zinc Production
- 2D Non-Energy Products from Fuels and Solvent Use
 - 2D1 Lubricant Use
 - 2D2 Paraffin Wax Use
 -

Methodology

The table 34 below details the sources of activity data used for estimating emissions from the IPPU sector. The production data used for estimating emissions from each product for the year 2019, 2020 and 2023 is detailed in table 35.

Table 34: Source of activity data¹² used for estimating emissions from IPPU sector

2C	Metal Industry			
2C1	Iron and Steel Production	500.67	500.67	500.67
2C6	Zinc Production	0.0	0.0	0.0
2D	Non-Energy Products from Fuels and Solvent Use			
2D1	Lubricant Use	41.8	44.43	41.55
2D2	Paraffin Wax Use	7.2	7.2	7.2

Assumptions

- Wherever year on year actual production/consumption data was not available, the installed capacity or average annual production data were obtained from Kerala State Pollution Control Board (KSPCB) and other line departments concerned.
- As per expert opinion from KSPCB the installed capacity itself was taken as the average production quantity where average production data was not available.

Table 36 provides insights on the tier level of methodology and emission factors used in estimating GHG emissions.

Table 36: Tier approach followed for the IPPU category

IPCC ID	GHG Source and Sink categories	CO ₂		CH ₄		N ₂ O	
		Method applied	Emission factor	Method applied	Emission factor	Method applied	Emission factor

2A Mineral Industry

2A1: Cement

Equation used

$$CO_2 \text{ Emissions} = \left[\sum_i (M_{ci} \cdot C_{cli}) - Im + Ex \right] \cdot EF_{clc} \quad (\text{IPCC 2006 Equation 2.1})$$

Where,

CO₂ Emissions = emissions of CO₂ from cement production, tonnes

M_{ci} = weight (mass) of cement produced of type i, tonnes

C_{cli} = clinker fraction of cement of type i, fraction

Im = imports for consumption of clinker, tonnes

Ex = exports of clinker, tonnes

EF_{clc} = emission factor for clinker in the particular cement, tonnes CO₂/tonne clinker

The table below provides the emission factor and clinker fraction used

Table 37: Factors used for estimating emissions from Cement industry

Factors	Value	Source
Emission factor for CO ₂ (EF _{clc})	0.537 t CO ₂ /t clinker	NATCOM 2
Clinker fraction of Portland pozzolana cement (C _{cli})	53.5% ¹³	IPCC 2006

¹³ The percentage clinker was taken as 53.5% considering the only source of cement production in Kerala i.e., Malabar Cements produces Portland pozzolana.

Emissions from the production of imported clinker cannot be included in emissions estimates as these emissions were produced and may have accounted for in another state. Similarly, emissions from clinker that are ultimately exported should be factored into estimates of the state where the clinker is produced. Based on expert opinion from KSPCB, there is no export of clinker from Kerala. As such based on expert inputs from KSPCB, the export and import of clinker was entirely not accounted for within these emission estimates.

2A2 Lime

Equation Used

$$E_{CO_2} = PP \cdot EF \text{ (slightly modified version of IPCC 2006 Equation 2.6)}$$

Where:

E_{CO_2} = CO₂ emissions from production of lime, tonnes

PP = annual production of lime, tonnes

EF = CO₂ emission factor for lime, tonnes CO₂/tonne lime produce (high calcium lime)

The table 39 below provides the emission factor used in estimating emissions from production of lime.

Table 38: Emission factor used for emissions estimation

Factors	Value	Source
Emission factor for CO ₂ (high calcium lime) (E_{CO_2})	0.75 t CO ₂ /t lime	IPCC 2006

2A4b Other uses of soda ash

Equation Used

$$CO_2 \text{ Emissions} = M_c \cdot (0.85EF_{ls} + 0.15EF_d) \text{ (IPCC 2006 Equation 2.14)}$$

Where:

CO₂ Emissions = emissions of CO₂ from other process uses of carbonates,

tonnes M_c = mass of carbonate consumed, tonnes

EF_{ls} or EF_d = emission factor for limestone or dolomite calcination, tonnes CO₂/tonne carbonate

Soda ash is primarily sodium carbonate, not limestone or dolomite. Therefore, the Tier 1 method for soda ash does not require the default fraction of 85%/15%. Emissions are estimated by multiplying the quantity of soda ash consumed on the state level by the emission factor (see table 39) for sodium carbonate.

Table 39: Emission factor used for emissions estimation

Factors	Value	Source
Emission factor for CO ₂	0.41492 t CO ₂ /t carbonate	NATCOM 2

2B Chemical Industry

2B1 Ammonia

Equation Used

$$E_{CO_2} = AP \cdot FR \cdot CCF \cdot COF \cdot 44/12 - R_{CO_2}$$

(IPCC 2006 Equation 3.1)

Where:

E_{CO₂} = Emissions of CO₂, kg

AP = Ammonia production, tonnes

FR = fuel requirement per unit of output, GJ/tonne ammonia produced

CCF = carbon content factor of the fuel, kg C/GJ

COF = carbon oxidation factor of the fuel, fraction

R_{CO₂} = CO₂ recovered for downstream use (urea production), kg

Table 40: Factors used for emissions estimates

Factors	Value	Source
Fuel requirement per unit of output	38.11624 GJ/t ammonia	NATCOM 2
Carbon content factor of the fuel	99.5%	NATCOM 2
Carbon oxidation factor of the fuel	14.4 Kg C/GJ	NATCOM 2
CO ₂ recovered for downstream use (urea production)	0	IPCC 2006

2B4 Caprolactam

Equation Used

$$E_{N_2O} = EF \cdot CP \quad (IPCC \ 2006 \ Equation \ 3.9)$$

Where:

E_{N_2O} = N₂O emissions, kg

EF = N₂O emission factor (default), kg N₂O/tonne caprolactam produced

CP = caprolactam production, tonne

Table 41: Emission factor used for emissions estimation

Factors	Value	Source
Emission factor for N ₂ O	9 kg N ₂ O/tonne caprolactam	NATCOM 2

2B6 Titanium Dioxide

Equation Used

$$E_{CO_2} = \sum_i (AD_i \cdot EF_i) \quad (IPCC \ 2006 \ Equation \ 3.12)$$

Where:

E_{CO_2} = emissions of CO₂, tonnes

AD_i = production of titanium slag, synthetic rutile or rutile TiO₂ (product i), tonnes

EF_i = CO₂ emissions per unit of production of titanium slag, synthetic rutile or rutile TiO₂ (product i), tonnes CO₂/tonne product

Table 43: Emission factor used for emissions estimation

Factors	Value	Source
Emission factor for CO ₂	1.385 tCO ₂ /t TiO ₂ produced	NATCOM 2

2B8f Carbon black

Equation Used

$$E_{CO_2} = PP \cdot EF \quad (IPCC \ 2006 \ Equation \ 3.15)$$

Where:

E_{CO_2} = CO₂ emissions from production of carbon black, tonnes

PP = annual production of carbon black, tonnes

EF = CO₂ emission factor for carbon black, tonnes CO₂/tonne product produced

$$ECH_4 = PP_i \cdot EF \quad (IPCC \ 2006 \ Equation \ 3.23)$$

Where:

ECH₄ = emissions of CH₄ from production of carbon black, kg

PP = annual production of carbon black, tonnes

EF= CH₄ emission factor for carbon black, kg CH₄/tonne product

Table 44: Emission factors used for emissions estimation

Factors	Value	Source
Emission factor for CO ₂	2.62 tCO ₂ /t carbon black produced	NATCOM 2
Emission factor for CH ₄	0.06 kg CH ₄ /t carbon black produced	NATCOM 2

2B7 Soda Ash

Equation Used

$$E_{CO_2} = AD \cdot EF \text{ (IPCC 2006 Equation 3.14)}$$

Where:

E_{CO₂} = emissions of CO₂, tonnes

AD = tonnes natural soda ash produced

EF = emission factor per unit of natural soda ash output

Table 44: Emission factor used for emissions estimation

Factors	Value	Source
Emission factor for CO ₂	0.138 tCO ₂ /t natural soda ash produced	IPCC 2006

2C Metal Industry

2C1 Iron and steel

Equation Used

CO₂ Emissions from Iron and Steel Production (IPCC 2006 Equation 4.4)

$$\text{Iron \& Steel: } E_{CO_2, \text{ non-energy}} = BOF \cdot EF_{BOF} + EAF \cdot EF_{EAF} + OHF \cdot EF_{OHF}$$

Where:

E_{CO₂, non-energy} = emissions of CO₂ to be reported in IPPU Sector, tonnes

BOF= quantity of BOF crude steel produced, tonnes

EAF = quantity of EAF crude steel produced, tonnes

OHF = quantity of OHF crude steel produced, tonnes

EF_x= emission factor, tonnes CO₂ /tonne x produced

Table 46: Emission factor used for emissions estimation

Factor	Value	Source
Emission factor -EAF	0.08 t CO ₂ /t production	NATCOM 2

As per expert opinion from KSPCB, it has been understood that the Iron and Steel making process in the state uses only Electric Arc Furnaces (EAF). Therefore, CO₂ emissions from the Iron and steel industry have been estimated by using Equation 4.4.

Further, as per KSPCB, there has been no occurrence of emissions from production of Pig iron, direct reduced iron, sinter and pellets, due to the absence of such processes in the respective industries. Hence, CH₄ and CO₂ emissions for these categories are regarded as zero

2C6 Zinc

Equation Used

CO₂ Emissions from Zinc Production (IPCC 2006 Equation 4.33)

$$E_{CO_2} = Zn \cdot EF_{default}$$

Where:

E_{CO₂} = CO₂ emissions from zinc production, tonnes

Zn = quantity of zinc produced, tonnes

EF_{default} = default emission factor, tonnes CO₂/tonne zinc produced

Table 46: Emission factor used for emissions estimations

Factor	Value	Source
CO ₂ emission factor	0.53 t CO ₂ /t zinc produced	NATCOM 2

2D Non- Energy Products from Fuels and Solvent Use

2D1 Lubricant Use

Equation Used

$$CO_2 \text{ Emissions} = LC \cdot CC_{Lubricant} \cdot ODU_{Lubricant} \cdot \frac{44}{12} \quad (IPCC 2006 \text{ Equation } 5.2)$$

Where:

CO₂ Emissions = CO₂ emissions from lubricants, tonne

CO₂ LC = total lubricant consumption¹⁴, TJ

CC_{Lubricant} = carbon content of lubricants (default), tonne C/TJ (= kg C/GJ)

ODU_{Lubricant} = Oxidised During Use (ODU) factor (based on default composition of oil and grease), fraction

¹⁴ Lubricant consumption data was multiplied by NCV (40.2 Tj/Kt) (Indian Network for Climate Change Assessment, 2010) to get consumption data in TJ

44/12 = mass ratio of CO₂/C

Table 47: Emission factor used for emissions estimates

Factor	Value	Source
Carbon content of lubricants	20 t-C/TJ	NATCOM 2
Oxidised During Use (ODU) factor	0.2	NATCOM 2

Limitation

Due to lack of segregated data, lubricants' consumption by 2-stroke engines have also been accounted for within the IPPU sector. Due to this, the emissions from this category were calculated using a Tier-1 approach.

2D2 Paraffin wax use

Equation Used

$$CO_2 \text{ Emissions} = PW \cdot CC_{Wax} \cdot ODU_{Wax} \cdot 44/12 \quad (IPCC 2006 \text{ Equation 5.4})$$

Where:

CO₂ Emissions = CO₂ emissions from waxes, tonne CO₂

PW = total wax consumption¹⁵, TJ

CC_{Wax} = carbon content of paraffin wax (default), tonne C/TJ (= kg C/GJ)

ODU_{Wax} = ODU factor for paraffin wax,
fraction (44/12) = mass ratio of CO₂/C

Table 48: Emission factors used for emissions estimates

Factor	Value	Source
Carbon content of paraffin wax	20 t-C/TJ	NATCOM 2
ODU factor	0.2	NATCOM 2

¹⁵ Paraffin wax consumption data was multiplied by NCV (40.2 Tj/Kt) (*Conversion factors, 2013*) to get consumption data in TJ

AGRICULTURE SECTOR

Key Highlights

- In Kerala, the Agriculture sector represented 6.1% of the gross GHG emissions (excluding LULUCF) in 2023
- In 2023, GHG emissions from the Enteric Fermentation category was the highest and accounted to 1006.96 kt CO₂e, constituting ~63.99% of the total Agriculture sector emissions.
 - Similarly, GHG emissions from Agriculture Soils accounted to 259.67 kt CO₂e, constituting ~16.50% of the total Agriculture sector emissions, in 2023. GHG emissions from Rice Cultivation accounted to 177.46 kt CO₂e, constituting ~11.28% of the total Agriculture sector emissions.
 - GHG emissions from manure management category accounted to 124.24 kt CO₂e, constituting ~7.90% of the total Agriculture sector emissions, in 2023.

Figure 3: GHG Emissions Estimates of Agriculture Sector – Kerala (2005 to 2023)

Sector Description

Emissions from the Agriculture sector arise from two main sub-sectors, namely Livestock, and Agriculture Practices.

The key economic sectors/categories included in the emission estimates are:

- 3A Livestock
 - 3A1 Enteric Fermentation
 - 3A2 Manure Management
- Agriculture Practices
 - 3C1b Emissions from biomass burning in croplands
 - 3C4 Direct N₂O emissions from managed soils

- 3C5 Indirect N₂O emissions from managed soils
- 3C7 Rice Cultivation

Methodology

The table 49 below details the sources of activity data used for estimating emissions

Table 49: Source of activity data¹⁶ used for estimating emissions from Agriculture sector

Category	Parameter	Year	Source
Livestock	Livestock Population	2003, 2007, 2012 and 2019	Livestock Census of India , Department of Animal Husbandry and Dairying
		2004 to 2006, 2008 to 2011 and 2013 to 2018	Interpolation method
		2020 to 2023	CAGR method
Biomass burning in cropland	Crop production	2004-05 to 2022-23	Department of Economics & Statistics, Government of Kerala Agriculture Statistics
		2023	CAGR method for the crops rice, cotton, sugarcane, groundnut, ragi, jowar since activity data was available till 2022-23. Data of 2022-23 used for the crop's wheat, maize, jute, rapeseed and mustard, small millets and bajra
	Groundnut production	2004-05	Directorate of Economics and Statistics, Department of Agriculture and Farmers welfare, Ministry of Agriculture and Farmers Welfare, Govt of India
Agriculture Soils	Nitrogen Consumption	2004-05 to 2020-21	Economics, Statistics and Evaluation Division, Department of Agriculture and Farmers Welfare, Ministry of Agriculture and Farmers Welfare, Government of India. 2007 (for 2004-05, 2005-06, 2006-07) 2009 (for 2007-08, 2008--09)

¹⁶ Activity data provided in financial year (FY) format was converted to calendar year (CY) format using the following equations:

$$\text{CY Activity data} = [\% \text{FY Activity Data}_{\text{Preceding year}}] + [\% \text{FY Activity Data}_{\text{Succeeding year}}]$$

Category	Parameter	Year	Source
			2012 (for 2009-10, 2010-11, 2011-12) 2013 , 2014 , 2015 , 2016 , 2017 , 2018 , 2019 , 2020 and 2021
		2021, 2022 and 2023	CAGR calculated between 2005 and 2020
	Urea Consumption	2004-05 to 2017-18	GHGPI Phase 4 datasheet which is sourced from Indian Fertilizer Scenario, Department of Fertilizers, Ministry of Chemicals and Fertilizers, Govt of India (currently reports are not available on the public domain)
		2018 - 2023	CAGR calculated between 2005-2017
Rice Cultivation	Rice Cultivated area	2005- 2022	Department of Economics & Statistics, Government of Kerala Agriculture Statistics
		2023	CAGR method
	The proportions of rice cultivated area under different water regimes.		Directorate of Agriculture Development and Farmers Welfare, Kerala

3A Livestock

3A1 Enteric Fermentation

Category Description

Methane emissions from Enteric Fermentation arise due to the process of ingesting and digesting food eaten by the herbivores, mainly bovines and ovines (Dhingra et al., 2019). Similarly, Methane and Nitrous Oxide emissions from the Manure management systems arise due to decomposition of manure under the anaerobic conditions due to storage and treatment or due to management of large numbers of animals in a confined area such as dairy farms, swines and poultry farms.

The livestock population activity data for both enteric fermentation and manure management emission estimations were obtained from Livestock Census of India. The detailed assumptions and emission factors used for emissions estimation are given below:

Methodology

The emissions resulting from Enteric Fermentation and Manure Management due to Livestock production in Kerala, have been estimated using the Tier 1 and Tier 2 approaches (See Table 50).

Due to lack of data on excretion of animals, livestock population (N_t) was multiplied by emission factor (for each type of animal category) in order to calculate the N_2O emissions from Manure Management.

Table 50: Type of emissions factor and the level of methodological tier employed for GHG estimation

Emission Factors

1. The country-specific emission factors for indigenous cattle, cross-bred cattle and buffalo were taken from NATCOM 2 (MoEFCC,2012). For the remaining categories, default emissions factors were obtained from 2006 IPCC guidelines (see Table51).

Table51: Emission Factors used

Category	Sub-category	Age group	Methane Emission Factor (NATCOM 2 and IPCC Guidelines)		Nitrous Oxide Emission Factor (GHGPI Phase 4)
			Enteric Fermentation (kg/CH ₄ /head/year)	Manure Management (kg/CH ₄ /head/year)	Manure Management (kg/head/year)
Indigenous Cattle	Dairy Cattle		28	3.5	0.0006
Indigenous Cattle	Non-Dairy Cattle	0-1 year	9	1.2	0.0004

Category	Sub-category	Age group	Methane Emission Factor (NATCOM 2 and IPCC Guidelines)		Nitrous Oxide Emission Factor (GHGPI Phase 4)
			Enteric Fermentation (kg/CH ₄ /head/year)	Manure Management (kg/CH ₄ /head/year)	Manure Management (kg/head/year)
Indigenous Cattle	Non-Dairy Cattle	1-3 year	23	2.8	0.0004

Camels	-	-	46	2.56	0
Pigs	-	-	1	4	0.0074
Poultry	-	-	0	0	0.0025

Equation Used

3A1 Enteric Fermentation

$$\text{CH}_4 \text{ Enteric} = \sum EF_{(T)} \cdot (N_{(T)} / 10^6) \quad (\text{IPCC 2006 Equation 10.19})$$

Where,

E_{missions} = methane emissions from Enteric Fermentation, Gg CH₄ yr⁻¹

$EF_{(T)}$ = emission factor for the defined livestock population, kg CH₄ head⁻¹ yr⁻¹

$N_{(T)}$ = the number of heads of livestock species/category T in the country

T = species/category of livestock

3A2 Manure Management

I. Methane Emissions from Manure Management

$$\text{Total CH}_4 \text{ Manure} = EF_{(T)} \cdot (N_{(T)} / 10^6) \quad (\text{IPCC 2006 Equation 10.22})$$

Where,

$CH_4 \text{ Manure}$ = methane emissions from Manure Management, Gg CH₄ yr⁻¹

$EF_{(TT)}$ = emission factor for the defined livestock population, kg CH₄ head⁻¹ yr⁻¹

$N_{(T)}$ = the number of heads of livestock species/category T in the country

T = species/category of livestock

II. Nitrous Oxide Emissions from Manure Management*

$$N_2O_{\text{animals}} \text{ Emissions (Gg/ Year)} = EF_{(\text{kg/ head/ year})} \times \text{population} / 10^6 \text{ (kg/ Gg)}$$

Where,

$N_2O \text{ Emissions}$ = N₂O emissions from Manure Management, Gg N₂O yr⁻¹

$EF_{(T)}$ = emission factor for the defined livestock population, kg N₂O head⁻¹ yr⁻¹

** Slightly modified version of equation 10.25 provided in the IPCC was used due to the type of EF provided in Indian Literature*

Emissions in terms of CO₂e (both GWP and GTP) were calculated using the following equations

$$\text{Emissions}_{\text{SCO}_2\text{e}} (\text{GWP}) = \text{Emissions}_{\text{CO}_2} + (\text{GWP}_{\text{CH}_4} \times \text{Emissions}_{\text{CH}_4}) + (\text{GWP}_{\text{N}_2\text{O}} \times \text{Emissions}_{\text{N}_2\text{O}})$$

$$\text{Emissions}_{\text{SCO}_2\text{e}} (\text{GTP}) = \text{Emissions}_{\text{CO}_2} + (\text{GTP}_{\text{CH}_4} \times \text{Emissions}_{\text{CH}_4}) + (\text{GTP}_{\text{N}_2\text{O}} \times \text{Emissions}_{\text{N}_2\text{O}})$$

Agriculture Practices

3C1b Biomass burning in Cropland

Category Description

From a climate change perspective, the combustion of crop residues leads to the release of N₂O and CH₄ gases. It is important to note that CO₂ emissions are not factored in, as they are offset by the absorption of CO₂ during the photosynthesis process that initially prompted the growth of biomass (IPCC, 2006).

Methodology

The crops considered for biomass burning in cropland are rice, wheat, cotton, maize, millets, sugarcane, jute, mustard and groundnut.

The methodological tiers adopted for estimating emissions from Biomass Burning in Cropland are as under:

Table 52: An overview of tier and emission factors used for biomass burning in cropland

IPCC ID	GHG Source and sink categories	CH ₄		N ₂ O	
		Method applied	Emission factor	Method applied	Emission factor
3C1b	Biomass Burning in Cropland	T1	D	T1	D
T1: Tier 1, D: IPCC Default					

In the absence of data on the amount of area burnt the methodology used here for estimating emissions from biomass burning in cropland is adopted from the MoEFCC, (2012).

Steps followed

Emissions from crop residue burning was calculated using the following equation from Bhatia et al., (2013)

$$FBCR = \sum Crops (A \cdot B \cdot C \cdot D \cdot E \cdot F)$$

Where,

FBCR is the emissions from residue burning (t)

A is the crop production (t)

B is the residue to crop ratio

C is the dry matter fraction,

D is the fraction burnt

E is the fraction oxidized

F is the emission factor for CH₄ and N₂O (g/kg)

Residue to crop ratio and dry matter fraction was taken from TIFAC & IARI,(2018), millet and jute were taken from MoEFCC, (2021) (see table 53). Fractions burnt for rice were taken from Gadde et al. (2009), and for the rest of the crops from MoEFCC, (2021) (see table 53).

Fractions of residues oxidized were obtained from Garg et al. (2011). (see table 53)

Table 53: Fractions used for estimation of emissions from biomass burning in cropland

Parameter	Rice	Wheat	Maize	Cotton	Sugarcane	Jute	Rapeseed & mustard	Ground nut	Millets
Residue to crop ratio	1.60	1.70	1.50	1.00	0.43	2.15	3.0	2.10	1.50
Dry matter fraction	0.86	0.88	0.88	0.80	0.88	0.80	0.80	0.80	0.88
Combustion factor	0.80	0.90	0.80	0.80	0.80	0.80	0.80	0.80	0.80
Fraction burnt	0.10	0.10	0.10	0.10	0.25	0.10	0.10	0.10	0.10

Default emission factors for different pollutants emitted from residue burning were taken from IPCC 2006, Chapter 2 (see table 54).

Table 54: Emission factors used for estimating biomass burning in cropland

Category	CH ₄ (g/kg)	N ₂ O (g/Kg)
Biomass burning in cropland	2.7	0.07

Limitations

- The fraction of rice burnt used for these calculations could be updated.

Estimation of Emissions from Agricultural Soils, including from:

3C4 Direct N₂O emissions from managed soils and

3C5 Indirect N₂O emissions from Managed Soils

Category Description

Soil N₂O emissions can be categorized into two types: direct and indirect. A portion of nitrogenous fertilizers applied in agricultural soils are lost into the atmosphere through direct emissions of N₂O through nitrification and denitrification. In addition, there are also indirect emissions of N₂O through volatilization losses, leaching and runoffs (IPCC, 2006).

Methodology

The fertilizer consumption data used for estimating emissions from this category for the year 2019, 2020, 2023 is detailed in table 56. The methodological tiers adopted for estimating emissions from Biomass Burning in Cropland are given in table 55:

Table 55: Methodological tier and emission factors used for biomass burning in cropland

IPCC ID	GHG Source and sink categories	N ₂ O	
		Method applied	Emission factor
3C4	Direct N ₂ O emissions from Managed Soils	T1	CS
3C5	Indirect N ₂ O emissions from Managed Soils	T2	CS
T1: Tier 1, T2: Tier 2, CS: Country specific			

Table 56: Fertilizer consumption Data used for Emission Estimation ('000 tonnes)

Consumption of Fertilizer	2019	2020	2021
Urea	128.77	129.03	129.29
Nitrogen	77.73	85.86	85.99

Steps followed

Total N₂O = N₂O direct + N₂O indirect ¹⁷

Calculation of direct N₂O emission

Step 1:

Quantity of nitrogen in other nitrogen fertilizers= Total N quantity consumed - Quantity of N in urea consumed

For calculating the quantity of nitrogen in urea, the total urea consumption was multiplied by 46 percent as urea contains 46% nitrogen. So, N consumed by other fertilizers was found by subtracting the N consumed in urea from the total N consumption.

¹⁷ The equations used for estimating direct N₂O emissions is slightly modified from IPCC equation based on the format of available dataset

Step 2:

Fraction loss= (Quantity of N in urea consumed *Fraction of gas loss through volatilised N from urea application) + (Quantity of nitrogen in other nitrogen fertilizers *Fraction of gas loss through volatilized N from Other fertilizer application)

Step 3:

N_2O direct= (Total N quantity consumed – Fraction loss) *Emission factor (EF1) * (44/28)

Calculation of indirect N_2O emission:

Indirect Emission from NH_3 Deposition on Soil from Urea = Quantity of N in Urea Consumed* Fraction of gas loss through volatilized N from Urea application* Emission factor (EF4) * (44/28)

Indirect Emission from NH_3 Deposition on Soil from Other fertilizer = Quantity of N in Other Nitrogen Fertilizers* Fraction of gas loss through volatilized N from Other fertilizer application* emission factor (EF4) * (44/28)

Indirect Emissions from Leaching of Fertilizers = Total N Quantity Consumed* Fraction of leaching loss of N applied fertilizer * emission factor (EF5) * (44/28)

The country specific emission factors and fractions used for estimating emissions from Agriculture Soils are as in Table 57.

Table 57: Emission factor used for Emissions Estimation of Agriculture Soil category

Parameter	Gas	Emission factor
Direct Emissions	N_2O	0.0058 Kg N_{20-N} /Kg N
Indirect Emissions - Atmospheric Deposition, Urea or Other fertilizers		0.005 Kg N_{20-N} /Kg N
Indirect Emissions - Leaching		0.005 Kg N_{20-N} /Kg N
Fraction of gas loss through volatilized N from Urea application		0.15 Kg N/kg N
Fraction of gas loss through volatilized N from Other fertilizer application		0.15 Kg N/kg N
Fraction of leaching loss of N applied fertilizer		0.1 Kg N/kg N

Source: BUR 3 (MoEFCC,2021)

Limitations

N₂O emissions could not be estimated due to the lack of availability of data for the following sub-categories:

- Nitrogen from compost
- Nitrogen from crop residue
- Manure nitrogen other than poultry
- Nitrogen input from below-ground biomass

3C7 Rice Cultivation

Category Description

This category includes emissions of methane by the anaerobic decomposition of soil organic material in flooded rice paddies (IPCC, 2006).

Methodology

The proportions of rice cultivated area under different water regimes as per the data provided by Directorate of Agriculture Development and Farmers Welfare, Kerala (see table 58) was applied to the cultivated area from 2005-2021 to get the area of rice under different water regimes from 2005-2023.

Table 58: Area of rice cultivated under different water regimes

Region	Area of rice cultivated	Water Regime
Kuttanad	33801	Single aeration (SA)
Pokkali	507	Single aeration (SA)
Kole	14724.3	Single aeration (SA)
Kaippad	3740	Single aeration (SA)
Palakkad plains and other paddy region	40736.7	Multiple aeration (MA)
Upland rice	511	Upland

Of the total land under rice cultivation, 56.13 per cent is under single aeration, 43.33 per cent under multiple aeration, and 0.54 percent is upland

The methodological tiers adopted for estimating emissions from Rice Cultivation are given in Table 59:

Table 59: An overview of tier and emission factors used for Rice Cultivation

IPCC ID	GHG Source and sink categories	CH ₄	
		Method applied	Emission factor
3C7	Rice Cultivation	T2	CS
T1: Tier 1, T2: Tier 2, D: IPCC Default, CS: Country specific			

The methodology used was the same as that used in MoEFCC, (2012). It has been referred from Gupta et al., (2009) and Pathak et al., (2010) using 2006 IPCC guidelines. The methane emissions are estimated by multiplying the total paddy rice area under different water management regimes (ha) with corresponding Emission Factor.

Equation Used

$$E_{RC} = A_C \times EF_W \times 10^{-6}$$

Where,

E_{RC} = CH₄ emissions from rice cultivation (Ggyear⁻¹),

A_C = area of rice cultivation under management C (ha)

EF_W = factor applied for different types of water management (kg CH₄ ha⁻¹)

10⁻⁶ = to convert Kg into Gg

The specific emission factors used were as follows:

Table 60: Country specific emission factors used for estimating emissions from Rice Cultivation

Water Regime	Type of gas	Emission factor
Single aeration	CH ₄	66 kg CH ₄ /ha
Multiple aeration	CH ₄	18 kg CH ₄ /ha
Upland	CH ₄	0 kg CH ₄ /ha

Source: Pathak, et al. (2010)

LAND USE, LAND-USE CHANGE AND FORESTRY (LULUCF) SECTOR

Key Highlights

- In Kerala, the Land Use, Land-Use Change and Forestry (LULUCF) sector remained a sink between 2005 and 2023.
- Forestland was the major contributor to GHG removals between 2005 and 2023
- The GHG removals from Settlements increased between 2005 and 2023 at a rate of 6.01% (compounded annually) from -0.02 Mt CO₂e to -0.05 Mt CO₂e.
- The Grassland and Other Land* category remained a sink until 2011. However, during the period 2012 – 2023, total annual emissions from these categories were 0.014 Mt CO₂e.

Figure 4: GHG Emissions Estimates of LULUCF Sector - Kerala (2005 to 2023)

Sector Description

Emissions from the Land Use, Land Use Change and Forestry (LULUCF) sector were estimated for Forest land and land conversions. The sub-sectors covered under LULUCF sector are listed below:

- 3B1. Forest Land
- 3C1a. Biomass burning in Forest Land
- 3B2 Cropland
- 3B3 Grassland
- 3B5 Settlements
- 3B6 Other Land*

*Other Land includes Barren Land/ Unculturable/wastelands

Methodology

The table 61 below details the sources of activity data used for estimating emissions:

Table 61: Source of activity data¹⁸ used for estimating emissions

Category	Parameter	Year	Source
Forest Land	Forest Cover	2004, 2006, 2008, 2010, 2013, 2015, 2017, 2019 and 2021 (reported assessment years)	India State Forest Reports, Forest Survey of India 2005 , 2009 , 2011 , 2013 , 2015 , 2017 , 2019 , 2021 2023
	Carbon Stock Density	(a) 2008 (b) 2015, 2017, 2019 and 2021	(a) Carbon Report , Forest Survey of India (b) India State Forest Reports, Forest Survey of India
Biomass burning in Forest land		2004-05 to 2008-09	Forest Statistics 2009 , Kerala Forest Department
		2009-10 to 2020-21	Kerala Forest Department
		2021-22 to 2023-24	CAGR method
Land	Cropland, Grassland, Settlements and Other Land	LULC matrix of (a) 2005-06 to 2011-12 (b) 2011-12 to 2015-16	(a) Envistats Reports 2018 (b) Envistats India 2020 (Ministry of Statistics and Programme Implementation, Government of India, 2020)

3B1. Forest Land

This category presents the emission estimates from Forest Land due to changes in dead organic matter, biomass and soil organic matter. The forest land data and the emission factor were obtained from the 'India State of Forest Report' and emissions from this category were estimated using the Tier 2 (T2) approach of IPCC Guidelines (see Table 62).

¹⁸ Activity data provided in financial year (FY) format was converted to calendar year (CY) format using the following equations:

$$CY \text{ Activity data} = [\frac{1}{4} * FY \text{ Activity Data}_{\text{Preceding year}}] + [\frac{3}{4} * FY \text{ Activity Data}_{\text{Succeeding year}}]$$

Table 62: Type of emission factor and the level of methodological tier employed for GHG estimation

IPCC ID	GHG Sources and sink categories	CO ₂	
		Method Applied	Emission Factor
3B1	Forest Land	T2	CS
T2: Tier 2, CS: Country specific			

Methodology:

a. Emissions Estimation

The year-on-year carbon stock was calculated by multiplying the carbon stock density and the forest cover data. The carbon stock density (CSD) data was available for the assessment years 2008, 2015, 2017, 2019 and 2021 from the Carbon Report and Forest Survey of India (FSI) reports.

The Carbon Stock Density was applied in the following format: 2008 CSD was applied between 2005 and 2008, 2015 CSD was applied between 2009 and 2015, 2017 CSD was applied for 2016-2017, 2019 CSD was applied for the years between 2018 and 2019, 2021 CSD was applied for the years between 2020 and 2021.

The GHG emissions from the forest land is estimated by applying Stock-Difference Method along with the activity data and emission factors, in-line with section 4.2.1.1 – choice of method, in Volume 4, Chapter 4, 2006 IPCC Guidelines.

The following Stock-Difference Method has been used for assessing the carbon stock changes

$$\Delta C = (C_{t_2} - C_{t_1}) / (t_2 - t_1) \text{ (IPCC 2006 Equation 2.5)}$$

Where,

ΔC = Annual Carbon stock change in pool (tonnes C yr⁻¹)

C_{t_1} = Carbon stock in the pool at time t_1 (tonnes C)

C_{t_2} = Carbon stock in the pool at time t_2 (tonnes C)

3C1a Biomass Burning in Forest Land

Category Description

The non-carbon dioxide emissions viz. Methane (CH₄) and Nitrous oxide (N₂O) were estimated for this category. The non-carbon dioxide emissions from biomass burning in forest land caused by both uncontrolled (wildfires) and managed (prescribed) fires. The activity data of this category were obtained from Kerala Forest Department. The data sources, assumption, methodology and emission factors are detailed below:

Methodology

The emissions from this category were estimated using the Tier 2 (T2) approach (see Table 63)

Table 63: Type of emissions factor and the level of methodological tier employed for GHG estimation

IPC C ID	GHG Sources and sink categories	CH ₄		N ₂ O	
		Method Applied	Emission Factor	Method Applied	Emission Factor
3C1a	Biomass Burning in Forest Land	T2	CS	T2	CS
T2: Tier 2, CS: Country specific					

Table 64: Factors used and sources

Parameter	Value	Source
Mass of fuel available for combustion (t/ha)	5.483 [#]	BUR 3
Combustion Factor	0.36	2006 IPCC Guidelines

#Scope for improvement: The estimations can be refined if the mass of fuel available for the combustion is replaced with the corresponding state-level equivalent. The mass of fuel available for combustion (5.483) is the average of biomass burnt in mild fire areas, moderate fire areas and heavy fire areas as provided in the BUR 3 report.

Emission Factor

Country specific emission factors for methane (CH₄) and nitrous oxide (N₂O) were obtained from NATCOM 2 (MoEFCC, 2012)

Table 65: Emission Factor Used

Parameter	Methane (CH ₄)	Nitrous Oxide (N ₂ O)
Emission factor (g/kg dry matter)	9	0.11

Limitations:

Tier 3 estimation requires use of detailed State Forest inventories with details on ecological zone and climate domain specific fuel dynamics in forests (growing stock, above ground biomass, dead organic matter).

Equation used to estimate the emissions

$$L_{fire} = A \cdot M_B \cdot C_f \cdot G_{ef} \cdot 10^{-3}$$

Where,

L_{fire} = amount of greenhouse gas emissions from fires, tonnes of each GHG e.g. CH₄, N₂O etc.

A = area burnt, ha

M_B = mass of fuel available for combustion, tonnes ha⁻¹. This includes biomass, ground litter and dead wood.

C_f = combustion factor, dimensionless

G_{ef} = emission factor, g kg⁻¹ dry matter burnt

3B2,3B3,3B5 & 3B6 Land sub-sector**Category Description**

The emissions from the Land sub-sector were estimated for the Cropland, Grassland, Settlements and Other land. The emissions from this category are caused due to changes in biomass carbon stock and soil organic carbon stock due to various land use practices – Land remaining Land as well as Land converted to any other Land category.

Methodology

1. The Land Use Land Cover Change Matrix of Kerala for the years between 2005-06 to 2011-12 and 2011-12 to 2015-16 were obtained from Envistats Reports 2018 and 2020 (Supplement on Environmental Accounts) – Ministry of Statistics and Programme Implementation (MOSPI), Govt. of India.
2. The rate of change of biomass (0.045 tC/ha/year) was obtained from BUR 3 report; Soil organic carbon stocks for Grassland and Other Land were obtained from Sreenivas et al (2016); Soil organic carbon stock for Cropland was obtained from Gladis et al (2020); Soil organic carbon stock for Settlements was obtained from

Sarkar et al (2022) and the Soil organic carbon for Wetlands was obtained from IPCC Guidelines.

3. The default stock change factors were obtained from IPCC Guidelines.

The emissions from this category have been estimated using the Tier 2 approach and country-specific emission factors (see Table 66)

Table 66: Type of emission factor and the level of methodological tier employed for GHG estimation

IPCC ID	GHG Sources and sink categories	CO ₂	
		Method Applied	Emission Factor
3B2	Crop Land	T2	CS
3B2a	Cropland Remaining Cropland	T2	CS
3B2bi	Forestland converted to Cropland	T2	CS
3B2bii	Grassland converted to Cropland	T2	CS
3B2biii	Wetland converted to Cropland	T2	D
3B2biv	Settlements converted to Cropland	T2	CS
3B2bv	Other Land converted to Cropland	T2	CS
3B3	Grassland	T2	CS
3B3a	Grassland Remaining Grassland	T2	CS
3b3bi	Forestland converted to Grassland	T2	CS
3b3bii	Cropland converted to Grassland	T2	CS
3b3biii	Wetland converted to Grassland	T2	D
3b3biv	Settlements converted to Grassland	T2	CS
3b3bv	Other Land converted to Grassland	T2	CS

3B5a	Settlements Remaining Settlements	T2	CS
3B5bi	Forestland converted to Settlements	T2	CS
3B5bii	Cropland converted to Settlements	T2	CS
3B5biii	Grassland converted to Settlements	T2	CS
3B5biv	Wetland converted to Settlements	T2	D
3B5v	Other Land converted to Settlements	T2	CS

IPCC ID	GHG Sources and sink categories	CO ₂	
		Method Applied	Emission Factor
3B6	Other land	T2	CS
3B6a	Other Land Remaining Other Land	T2	CS
3b6bi	Forestland converted to Other Land	T2	CS
3b6bii	Cropland converted to Other Land	T2	CS
3b6biii	Grassland converted to Other Land	T2	CS
3b6biv	Wetland converted to Other Land	T2	D
3b6bv	Settlements converted to Other Land	T2	CS
3B4	Wetlands	Not Estimated	
T2: Tier 2; CS: Country specific; D: IPCC default			

The biomass factor used for the emission estimation have been detailed below in Table 67.

Table 67: Biomass Factor

Years applicable	Factor	
For LULC upto 2011-12	Rate of change in biomass carbon in tC/ha/yr	0.045
For LULC upto 2015	Rate of change in biomass carbon in tC/ha/yr	0.045

Source: BUR 3

Assumptions:

The biomass factor obtained from BUR 3 was derived using country specific biomass conversion and expansion factors.

Scope for improvement

Tier 3 inventories for Land (except Forest Land) can be developed using measurements and modeling – accounting for deadwood, litter along with above and below ground biomass, wood harvested products, soil organic carbon.

Equations used for emissions estimation:

The equations used to estimate the emission from Land sub-sector (except forest land) due to Land Use and Land cover Change has been explained below

Emissions from Land sub-sector (except forest land) = Change in biomass carbon stock + Change in organic carbon stock in mineral soils

The equations of Change in biomass carbon stock and Change in organic carbon stock in mineral soils is detailed below:

(a) Change in biomass carbon stock

$$\Delta C_G = \sum_{i,j} (A_{ij} \cdot G_{Total\ ij} \cdot CF_{ij}) \quad (IPCC\ 2006\ Equation\ 2.9)$$

Where,

ΔC_G = annual increase in the biomass carbon stocks in land remaining land or land changing to another land use (tonnes of C yr⁻¹)

A_i = area of land remaining in land use category or area of land changed to another land use category (ha)

G_{Total} = mean annual biomass growth tonnes d. m. ha⁻¹ yr⁻¹

CF = carbon fraction of dry matter, tonnes C (tonne d.m.)⁻¹

(b) Change in organic carbon stock in mineral soils

$$\Delta C_{Mineral} = (SOC_0 - SOC_{(0-T)}) / D$$

$$SOC = \sum (SOC_{REF} \cdot F_{LU} \cdot F_{MG} \cdot F_i \cdot A)$$

(IPCC 2006 Equation 2.25)

Where,

SOC_0 = soil organic carbon in the last year of the inventory period-final land use type (tC)

$SOC_{(0-T)}$ = soil organic carbon in the beginning of the inventory period-initial land use type (tC)

T = number of years over single inventory period

D = default time period (assumed to be 20 years)

SOC_{REF} = reference carbon stock (tC ha⁻¹)

F_{LU} , F_{MG} , F_i = stock change factors for particular land use, management regime and input organic matter (dimensionless)

A = area of land stratum being estimated (ha)

WASTE SECTOR

Key Highlights

- The Waste sector contributed to almost 7.5% of gross GHG emissions (excluding LULUCF) of Kerala in 2023.
- In the Waste sector, domestic wastewater is the major contributing key source category with an average share of 96.14%. It is followed by industrial waste water (2.16%) and municipal solid waste (1.70%)
- GHG emissions from the Waste sector of Kerala declined at a CAGR of 0.06%, from 1.94 Mt CO₂e in 2005, to 1.92 Mt CO₂e in 2023.

Figure 5: GHG Emissions Estimates of Waste Sector - Kerala (2005 to 2023)

Sector Description

The key economic sectors/categories included in the emission estimates from Waste sector are:

- 4A Solid Waste Disposal
- 4D Wastewater treatment and discharge
 - 4D1 Domestic Wastewater Treatment and Discharge
 - 4D2 Industrial Wastewater Treatment and Discharge

4A Solid Waste Disposal

Category Description

When solid waste is disposed of in landfills or dumpsites under anaerobic conditions, methanogenic bacteria break down the waste's degradable organic component, creating CH₄ emissions. The organic material decomposes slowly, and the CH₄ emissions from a particular quantity of dumped solid waste continue to be released for a few decades (GHGPI Phase III)¹⁹. The current assessment covers the disposal of municipal solid waste of Kerala. The Municipal Solid Waste includes waste from residential, commercial and institutional waste, street sweeping, parks and gardens which are either in semi-solid or solid form (excludes industrial, hazardous, bio- medical and e-waste). Further, the rural areas have not been included in estimation due to lack of reliable data.

The First order Decay (FOD) model was used in the emissions estimation and it assumes that carbon in waste decays gradually for decades to generate CH₄ emission long after it is disposed of and hence, it is necessary to estimate or collect 50-year data on waste disposal prior to the base year of 2005 (GHGPI Phase III)²⁰. For Kerala, the emissions from the solid waste disposal were estimated from 1951 to 2021 keeping the FOD assumptions as reference.

Methodology

The methodology followed for the Methane (CH₄) emission estimations from solid waste disposal of Kerala includes both Tier 1 (T1) and Tier 2 (T2) approach.

Table 68: Source of activity data²¹ used for estimating emissions from Waste sector

T1: Tier 1; T2: Tier 2; CS: Country-specific; D: IPCC default			

Equations used for Emissions Estimates

The following equations have been used to estimate CH₄ emissions from Solid waste disposal in accordance with 2006 IPCC Guidelines

CH₄ Emissions from Solid Waste Disposal Sites

$$CH_4 \text{ Emissions} = \left[\sum_x CH_4 \text{ generated}_{x,T} - R_T \right] (1 - OX_T) \quad (\text{IPCC 2006 Equation 3.1})$$

Where,

CH₄ Emissions = CH₄ emitted in year T,

Gg T = inventory year

X = waste category or type/material

R_T = recovered CH₄ in year T, Gg (default value of 0) (IPCC, 2006)

OX_T = oxidation factor in year T, (fraction) (default value of 0) (IPCC, 2006)

The amount of CH₄ formed from decomposable material is found by multiplying the CH₄ fraction in generated landfill gas and the CH₄/C molecular weight ratio (16/12)

CH₄ Generated from Decayed DDOCm

$$CH_4 \text{ generated}_T = DDOCmdecomp_T \cdot F \cdot 16/12 \quad (\text{IPCC 2006 Equation 3.6})$$

Where,

CH₄ generated_T = amount of CH₄ generated from decomposable material

DDOCmdecomp_T = Decomposable Degradable Organic Carbon (DDOC) decomposed in year T, Gg

F = fraction of CH₄, by volume, in generated landfill gas (fraction)

16/12 = molecular weight ratio CH₄/C (ratio)

Decomposable DOC from Waste Disposal Data

$$DDOC_m = W \cdot DOC \cdot DOC_f \cdot MCF \quad (IPCC\ 2006\ Equation\ 3.2)$$

Where,

$DDOC_m$ = mass of decomposable DOC deposited,

Gg W = mass of waste deposited for the state, Gg

DOC = degradable organic carbon for the respective state in the year of deposition, fraction,
Gg C/Gg waste

DOC_f = fraction of DOC that can decompose (fraction)

MCF = CH_4 correction factor for aerobic decomposition in the year of deposition
(fraction)

Estimated DOC using Default Carbon Content Values

$$DOC = \sum_i (DOC_i \cdot W_i) \quad (IPCC\ 2006\ Equation\ 3.7)$$

Where,

DOC = fraction of degradable organic carbon in bulk waste, Gg C/Gg waste

DOC_i = fraction of degradable organic carbon in waste type i

W_i = fraction of waste type i by waste category

DDOC_m Accumulated in the SWDS at the end of Year T

$$DDOC_{maT} = DDOC_{mdT} + (DDOC_{maT-1} \cdot e^{-k}) \quad (IPCC\ 2006\ Equation\ 3.4)$$

DDOC_m Decomposed at the end of the Year T

$$DDOC_{m\ decompT} = DDOC_{maT} - 1 \cdot (1 - e^{-k}) \quad (IPCC\ 2006\ Equation\ 3.5)$$

Where,

T = inventory year

$DDOC_{maT}$ = $DDOC_m$ accumulated in the SWDS at the end of year T, Gg

$DDOC_{maT-1}$ = $DDOC_m$ accumulated in the SWDS at the end of year (T-1),

Gg $DDOC_{mdT}$ = $DDOC_m$ deposited into the SWDS in year T, Gg

$DDOC_{m\ decompT}$ = $DDOC_m$ decomposed in the SWDS in year T,

Gg k = reaction constant (0.17), $k = \ln(2)/t_{1/2}$ (y-1)

$t_{1/2}$ = half-life time (y)

Euler's Constant $e = 2.718$

Table 70: Default Values for Emissions Estimations of Solid Waste Disposal²²

Parameter	Default Values
Fraction of Degradable Organic Carbon which decomposes (DDOC _f)	0.5
Methane Correction Factor (Unmanaged shallow solid waste disposal site with depth less than 5 meter)	0.4
Fraction of CH ₄ in Generated Landfill Gas (F)	0.5
Oxidation Factor (OX)	0
Methane Recovery (R)	0
Reaction Constant (k)	0.84

Source: IPCC, 2019 (Volume 5, Chapter 3-Solid Waste Disposal)

Data Sources and Assumptions:

1. Population:

- The urban population for years 1951, 1961, 1971, 1981, 1991 and 2001 to 2023 data were obtained from Census of India reports
- For the years in between, the urban population was calculated using the CAGR method.

2. Mass of Waste Deposited

The mass of waste deposited to the dumpsite was estimated using the urban population, per capita waste generation and proportion of waste going to the dumpsite.

a. Per capita waste generation

- The per capita waste generation data for the year 1996 was obtained from the study conducted in Kerala by Varma (2015) and for the years 2001 and 2006, the per capita waste generation data was derived based on the reported total waste generation data in the study.
- For the year 2020, the per capita waste generation data was derived based on the total waste generation data reported in the Suchitwa Mission Report (2020)²³.
- The per capita waste generation for all the intermediate years between 1996 and 2023 was estimated using CAGR.

²² As per 2019 IPCC Guidelines, Volume 5, Chapter 3 - Solid Waste Disposal
Available at https://www.ipcc-nggip.iges.or.jp/public/2019rf/pdf/5_Volume5/19R_V5_3_Ch03_SWDS.pdf

²³ Suchitwa Mission (2020) Introduction And Strategic Environmental Assessment of Waste Management Sector In Kerala (Volume I)

Table 71: Per capita waste generation of Kerala

Year	Solid Waste Generation (TPD)	Urban Population	Per Capita Waste Generation (g/person/day)
1996	-	-	210
2001	1752	49,03,172	357.32
2006	1941	54,11,995	358.65
2020	Low land (Coastal area)– 2,115 Mid Land – 1,275 Highland - 365	Low land (Coastal area)– 41,62,180 Mid Land – 29,41,234 Highland – 8,72,437	453.34 (average value)

- An Annual Growth rate in per capita waste generation (1.41%) was applied backward from 1995 to 1951 for accounting potential emissions from legacy waste. This annual growth rate in per capita waste generation was obtained from Varma (2015).

b. Proportion of Waste Going to the Dumpsites:

- The proportion of solid waste going to the dumpsite for years between 1951 and 2004 was taken as 70% (National Average) as per NATCOM 2 .
- Based on the Suchitwa Missions inputs with reference to the Kerala Solid Waste Management Policy, 2018, the proportion of non-biodegradable waste was estimated as 12.6%. This proportion was applied between 2005 to 2016, due to unavailability of data in the said period.
- The proportion of waste going to the dumpsite for the period 2017 to 2023 was applied as Zero, as per inputs from Kerala State Pollution Control Board.

3. Degradable Organic Carbon (DOC):

Aggregate Degradable Organic Carbon (DOC) was calculated based on the shares of degradable fraction in Waste Composition (Compostable, Paper and Rags) and Default DOC content values as per 2006 IPCC Guidelines (as seen in Table 72).

- The Aggregate Degradable Organic Carbon (DOC) value for year 1971 was estimated using the National-level share of degradable fraction in Waste Composition (Compostable, Paper and Rags) and was applied for years between 1951 to 1994.
- The shares of degradable organic fraction in Waste Composition (Compostable, Paper and Rags) data for years 1995 and 2005 were taken from GHGPI Phase III. The calculated Aggregate Degradable Organic Carbon (DOC) value for 1995 and 2005 was applied for years 1995 to 2004 and 2005 to 2023 respectively.

Table 72: Default Degradable Organic Content (DOC) Values in Wet Waste²⁴

Component	Default DOC Content values (in percentage)
Compostable Matter	15
Rags	24
Paper	40

Source: IPCC, 2006

(Volume 5, Chapter 2-Waste Generation, Composition, and Management Data, Table 2.4)

Table 73: Degradable Organic Carbon values estimated based on reported Waste composition

Reported Year	Waste Composition (in %)			Aggregate DOC Value (in fraction)	Applicable Years
	Compostable	Paper	Rags		
1971	41.24	4.14	3.83	0.088	1954-1994
1995	41.8	5.78	3.5	0.094	1995-2004
2005	65.15	16.86	5.87	0.129	2005- 2023

4. DDOC decomposed in year T ($DDOC_{m,decompT}$)

The $DDOC_m$ (i.e. the Decomposable Degradable Organic Carbon) decomposed in the year T ($DDOC_{m,decompT}$) depends on the $DDOC_m$ deposited in the year T ($DDOC_{mdT}$), the $DDOC_m$ accumulated at the end of year T ($DDOC_{maT}$), and the $DDOC$ accumulated at the end of the previous year (T-1) ($DDOC_{maT-1}$). It is assumed the $DDOC$ accumulated in the initial year of the 50-year time period considered under the FOD model (i.e. 1954) is zero. Using the values estimated for $DDOC$ deposited and $DDOC$ accumulated, the $DDOC_m$ decomposed is calculated for all the 50-year period from 1954-2004 and subsequently is used to estimate CH_4 emissions from 2005 - 2023 (GHGPI Phase III)²⁵.

²⁴As per 2006 IPCC Guidelines, Volume 5, Chapter 2 -Waste Generation, Composition, and Management Data, Table 2.4

Available at https://www.ipcc-nggip.iges.or.jp/public/2006gl/pdf/5_Volume5/V5_2_Ch2_Waste_Data.pdf

²⁵ Kolsepatil, N., Anandhan, S., Sekhar, A., Chaturvedula, S. (2019). Greenhouse Gases Emissions of India (subnational estimates): Waste Sector (2005-2015 series) dated September 25, 2019, Retrieved from: <http://www.ghgplatform-india.org/waste-sector>

Limitations:

- a. The per capita waste generation of Kerala data was available only for the years 2001, 2006 and 2020.
- b. The Aggregate Degradable Organic Carbon (DOC) was estimated using 2006 IPCC Guideline's default Degradable Organic Carbon (DOC) values, since state specific DOC values were not available.

4D1 Domestic Wastewater Treatment and Discharge

Category Description

Wastewater can be a source of methane (CH₄) when treated or disposed of anaerobically. The breakdown of protein in domestic wastewater can also be a source of nitrous oxide (N₂O) emissions. Carbon dioxide (CO₂) emissions from wastewater are not considered in the IPCC Guidelines because these are of biogenic origin and should not be included in national total emissions.²⁶

Methodology

The table 74 below details the sources of activity data used for estimating emissions from the Domestic Wastewater category.

Table 74: Source of activity data used for estimating emissions from Domestic Wastewater category

Activity data	Source
State population	2005-2010: Census of India 2001 Population Projections for India and States 2001-2026 2011-2023: Census of India 2011 Population Projections for India and States 2011-2036
Degree of utilisation	NSS Division, Department of Economics & Statistics, Government of Kerala. Report on NSS Socio Economic Survey Report on NSS Socio economic Survey 65th Round: Housing Conditions and amenities in Kerala 2008-2009 Report on NSS Socio economic Survey 76th Round: Drinking water, sanitation and Housing Condition in Kerala 2018 Percentage of piped sewer system in rural areas from 2005-2023 is considered nil based on expert opinion from Kerala Water Authority

²⁶ Because the methodology is on a per person basis, emissions from commercial wastewater are estimated as part of domestic wastewater. To avoid confusion, the term municipal wastewater is not used in this text. Municipal wastewater is a mix of household, commercial and non-hazardous industrial wastewater, treated at wastewater treatment plants.

Activity data	Source
STP Status	Ratio of treatment type (aerobic/anaerobic) • Central Public Health and Environmental Engineering Organization (CPHEEO), Status of Water Supply, Sanitation and Solid Waste Management in Urban Areas- 1999 • For the year 2008-09, data taken from Central Pollution Control Board, (2013)- Performance Evaluation of Sewage Treatment Plants Under NRCD- 2013 report of CPCB • Central Pollution Control Board- Inventorization of Sewage Treatment Plants 2015, 2020 and based on expert opinion from Kerala Water Authority (KWA). % of sewer collected and not treated if any • Based on expert opinion from Kerala Water Authority (KWA)
Protein intake (g/person/day)	National Sample Survey Organization, Ministry of Statistics & Programme Implementation, Government of India, Nutritional intake in India 2004-05 , 2009-10 , 2011-12
Average per capita BOD	National Environmental Engineering Research Institute (NEERI), 2010: Inventorisation of Methane Emissions from Domestic & Key Industries Wastewater – Indian Network for Climate Change Assessment

The overall methodology followed for domestic wastewater related state-level CH₄ and N₂O emissions estimates are consistent with the IPCC Tier 1 approach. While a majority of the activity data used is state specific, default values of the emission factors as per the 2006 IPCC Guidelines have been used for estimation of CH₄ and N₂O emissions.

Table 75: Type of Emission Factor and Level of Methodological Tier adopted for Domestic Wastewater Treatment and Discharge

IPCC ID	GHG source & sink categories	CH ₄		N ₂ O	
		Method applied	Emission factor	Method applied	Emission factor
4D1	Domestic wastewater treatment and discharge	T1	D	T1	D
T1: Tier 1; D: IPCC Default					

Equation Used:

As per the 2006 IPCC Guidelines, the following equation is used to estimate CH₄ emissions from domestic wastewater treatment and discharge.

$$CH_4 \text{ Emissions} = \left[\sum_{i,j} \left(U_i \cdot T_{i,j} \cdot EF_j \right) \right] (TOW - S) - R \text{ (IPCC 2006 Equation 6.1)}$$

Where,

CH₄ Emissions = Methane emissions in inventory year, kg CH₄/yr

TOW = total organics in wastewater in inventory year, kg BOD/yr

S = organic component removed as sludge in inventory year, kg BOD/yr (default value of 0) (IPCC, 2006)

T_j = degree of utilization of treatment/discharge pathway or system, j

j = each treatment/discharge pathway or system

EF_j = emission factor, kg CH₄/ kg BOD

R = amount of CH₄ recovered in inventory year, kg CH₄/yr (default value of 0) (IPCC, 2006)

A key parameter for this source category is the total amount of organically degradable material in the wastewater (TOW). This parameter is a function of human population and Biochemical Oxygen Demand (BOD) content of wastewater generated per person. It is expressed in terms of biochemical oxygen demand (kg BOD/year)²⁷. The equation for TOW in domestic wastewater is

$$TOW = P \cdot BOD \cdot 0.001 \cdot I \cdot 365 \text{ (IPCC 2006 equation 6.3)}$$

Where,

TOW = total organics in wastewater in inventory year, kg BOD/yr

P = population in inventory year, (person)

BOD = state-specific per capita BOD in inventory year, g/person/day

0.001 = conversion from grams BOD to kg BOD

I = correction factor for additional industrial BOD discharged into sewers

(for collected the default is 1.25, for uncollected the default is 1.00)

The emission factor (see table 78) for a wastewater treatment and discharge pathway and system is a function of the maximum CH₄ producing potential (Bo) and the methane correction factor (MCF) for the wastewater treatment and discharge system. The Bo is the maximum amount of CH₄ that can be produced from a given quantity of organics (as expressed in BOD or COD) in the wastewater. The MCF, on the other hand, reflects the degree to which the methane-producing capacity (Bo) is realized in various types of treatment and discharge systems, serving as an indicator of the system's anaerobic nature²⁸.

²⁷ Kolsepatil, N., Anandhan, S., Sekhar, A., Chaturvedula, S. (2019). Greenhouse Gases Emissions of India (subnational estimates): Waste Sector (2005-2015 series) dated September 25, 2019, Retrieved from: <http://www.ghgplatform-india.org/waste-sector>

²⁸ 2006 Intergovernmental Panel on Climate Change (IPCC) Guidelines for National Greenhouse Gas Inventories, Volume 5, Waste, Chapter 6

$$EF_j = B_0 \cdot MCF_j \text{ (IPCC 2006 equation 6.2)}$$

Where:

EF_j = emission factor, kg CH₄/kg BOD

j = each treatment/discharge pathway or system

B_0 = maximum CH₄ producing capacity, kg CH₄/kg BOD (Default value 0.6) (IPCC,2006)

MCF_j = methane correction factor (fraction) see table 76.

Table 76: Default MCF values by treatment type and discharge pathway

Type of treatment and discharge pathway or system	Description	MCF
Untreated system		
Sea, river and lake discharge	Rivers with high organic loadings can turn anaerobic	0.1
Stagnant sewer	Open and warm	0.5
Flowing sewer (open or closed)	Fast moving, clean. (Insignificant amounts of CH ₄ from pump stations, etc.)	0
Treated system		
Centralized, aerobic treatment plant	Must be well managed. Some CH ₄ can be emitted from settling basins and other pockets	0
Centralized, aerobic treatment plant	Not well managed. Overloaded.	0.3
Anaerobic digester for sludge	CH ₄ recovery is not considered here.	0.8
Anaerobic reactor	CH ₄ recovery is not considered here.	0.8
Anaerobic shallow lagoon	Depth less than 2 metres, use expert judgment	0.2
Anaerobic deep lagoon	Depth more than 2 metres	0.8
Septic system	Half of BOD settles in anaerobic tank	0.5
Latrine	Dry climate, ground water table lower than latrine, small family (3-5 persons)	0.1
Latrine	Dry climate, ground water table lower than latrine, communal (many users)	0.5
Latrine	Wet climate/flush water use, ground water table higher than latrine	0.7
Latrine	Regular sediment removal for fertilizer	0.1

Source: IPCC 2006 (Vol. 5, Chapter 6; Table 6.3)

In the emission estimates, corresponding default MCF values as per the 2006 IPCC Guidelines (given in table 77) have been used based on the applicable treatment/discharge pathways or systems.

Table 77: MCF values considered for various treatment types²⁹.

Treatment/ discharge pathway or system (j)	Classification of the system (Collected/ Uncollected and Treatment)	Specific Treatment/Discharge pathway or system (j) selected from Table 76	MCF_j
Sewer	Collected (Anaerobic treatment)	Anaerobic reactor/Anaerobic digester for sludge	0.80
	Collected (Aerobic treatment)	Centralized, aerobic treatment plant, well managed	0
	Collected (No Treatment)	Stagnant Sewer	0.50
	Collected (treated/untreated)	Flowing sewer (Open/Closed)	0
Other	Uncollected (No Treatment)	Sea Lake or river discharge	0.10
None	Uncollected (No Treatment)	Sea Lake or river discharge	0.10
Septic tank	Uncollected (Treatment on-site)	Septic system	0.50
Latrine	Uncollected (Treatment on-site)	Latrine (Dry climate, ground water table lower than latrine, small family (3-5 members))	0.10

Table 78: Methane emission factor used for estimating emissions from domestic wastewater category

Type of latrine	Emission factor (kg CH₄/kg BOD)
Septic tank	0.3
Latrine	0.06
Others & none	0.06
Sewer (collected and aerobic treatment, well managed)	0
Sewer collected and not treated	0.3
Sewer (collected and anaerobic treatment)	0.48

²⁹ Kolsepatil, N., Anandhan, S., Sekhar, A., Chaturvedula, S. (2019). Greenhouse Gases Emissions of India (subnational estimates): Waste Sector (2005-2015 series) dated September 25, 2019, Retrieved from: <http://www.ghgplatform-india.org/waste-sector>

N₂O Emissions from Domestic Wastewater

$$N_2O \text{ Emissions} = N_{\text{EFFLUENT}} \cdot EF_{\text{EFFLUENT}} \cdot 44/28 \quad (\text{IPCC 2006 equation 6.7})$$

Where,

N₂O emissions = N₂O emissions in inventory year, kg N₂O/yr

N_{EFFLUENT} = nitrogen in the effluent discharged to aquatic environments, kg N/yr

EF_{EFFLUENT} = emission factor for N₂O emissions from discharged to wastewater, kg N₂O-

N/kg N The factor 44/28 is used for conversion of kg N₂O-N into kg N₂O

The total nitrogen in the effluent is estimated as follows

$$N_{\text{EFFLUENT}} = (P \cdot \text{Protein} \cdot F_{\text{NPR}} \cdot F_{\text{NON-CON}} \cdot F_{\text{IND-COM}} - N_{\text{SLUDGE}})$$

(IPCC 2006 equation 6.8)

Where,

N_{EFFLUENT} = total annual amount of nitrogen in the wastewater effluent,

kg N/yr P = human population

Protein = annual per capita protein consumption, kg/person/yr

F_{NPR} = fraction of nitrogen in protein, kg N/kg protein (default value of 1.1) (IPCC,

2006) F_{NON-CON} = factor for non-consumed protein added to the wastewater

(default value of 1.1) (IPCC, 2006)

F_{IND-COM} = factor for industrial and commercial co-discharged protein into the sewer system, (default value of 1.25) (IPCC, 2006)

N_{SLUDGE} = nitrogen removed with sludge, kg N/yr (default value of 0) (IPCC, 2006)

Table 79: N₂O emission factor used for estimating emissions from domestic wastewater category

Gas	Emission factor (kg N ₂ O-N/kg N)
N ₂ O	0.005

Source: IPCC 2006 (Volume 5, Chapter 6)

Assumptions

1. BOD

Year-wise values of BOD generated per person are not available for the state, hence an average national value for BOD of 40.5 gm/person/day is used across the reporting period. While converting BOD values from daily basis to an annual basis, 365 days have been assumed across all years, including for leap years, in line with the equation for TOW calculation in the 2006 IPCC Guidelines.

2. Correction factor for additional Industrial BOD discharged into sewers (I)

Effluent from industries and commercial establishments is often co-discharged in sewers and mixes with domestic wastewater. This correction factor 'I' accounts for additional BOD from mixing of such industrial and commercial effluent with domestic wastewater. Based on the Second National Communication for India and the 2006 IPCC Guidelines, the default values of 1.25 for 'I' for collected wastewater and 1 for uncollected wastewater respectively are used in this assessment³⁰.

3. Per Capita Protein Consumption

Year-on-year per capita protein consumption data at the state level are not available; therefore, urban per capita protein consumption values from NSSO surveys for 2004–05, 2009–10, and 2011–12 were used for emission estimation for the periods 2005–2008, 2009–2010, and 2011–2023, respectively. While converting protein consumption values from daily basis to an annual basis, 365 days have been assumed across all years, including for leap years (Kolsepatil et al., 2019)³¹.

4. Degree of Utilization of treatment/discharge pathway or system j, for each income group fraction i (Ti,j)

The degree of utilization expresses the share of each discharge system in the treatment of the total wastewater generated by the population. This is a key parameter since this relates to the proportion of the resident population using different wastewater treatment/discharge pathways or systems. Each of treatment/discharge pathways or systems will have different CH₄ emission factors (based on IPCC defined MCF values as listed in table 76; thereby having a varying contribution to the GHG emissions. The treatment/discharge pathways or systems are broadly classified by the 2006 IPCC Guidelines into collected systems (i.e. wherein wastewater is conveyed using a sewer network) and uncollected systems (wastewater not conveyed using a sewer network). The degree of utilization values considered for domestic wastewater in this assessment, based on NSS Socio economic surveys are listed in table 80.

Table 80: Degree of utilization

Treatment type/discharge type	Share of population using treatment/ Discharge pathway or system (2008-09)	Share of population using treatment/ Discharge pathway or system (2018)
Septic tank	29.43%	24.62%
Pit latrine	68.61%	74.06%
Sewer	0.18%	0.26%
Others/None	1.78%	1.07%

³⁰Kolsepatil, N., Anandhan, S., Sekhar, A., Chaturvedula, S. (2019). Greenhouse Gases Emissions of India (subnational estimates): Waste Sector (2005–2015 series) dated September 25, 2019, Retrieved from: <http://www.ghgplatform-india.org/waste-sector>

³¹Ibid.

- The treatment/discharge type for urban and rural population were obtained from the [NSS Socio Economic Survey 2008-09](#) and [2018](#). Urban and rural degree of utilization of 2008 and 2018 was multiplied by urban and rural population (Census) of 2008 and 2018 to derive the population (urban and rural) served by each latrine system. The total percentage of degree of utilization of each latrine system was derived by adding the population (urban and rural) served by each latrine system.
- The corresponding degree of utilization estimated for the population based on the 2008-09 survey is assumed to be applicable for the period 2005-2014, and the survey results of 2018 was applied for the period 2015-2023, based on expert inputs.
- The change in latrine type-wise shares between 2005 and 2015 was applied incrementally by using CAGR.
- The categories mentioned in [NSS Socio Economic Survey-Housing Condition and Amenities in Kerala 2008-09](#) (Table 10 -Appendix A) are service latrine, pit latrine, septic tank/flush, not known, others,n.r. They have been reconciled with [NSS 2018](#) categories (see table 81) based on inputs from sector experts from Suchitwa Mission and Directorate of Environment and Climate Change (DoECC), Kerala.

Table 81: Latrine System Categories

Categorisation followed in GHG inventory	NSS 2018 categories
Piped sewer system	Flush/pour-flush to piped sewer system
Septic tank	Flush/pour-flush to septic tank
Other system	Flush/pour-flush to twin leach pit/single pit
	Flush/pour-flush to elsewhere
Pit latrine	Ventilated improved pit latrine
	Pit latrine with slab
	Pit latrine without slab/open pit
	Flush/pour-flush to single pit
	Composting latrine (0 for both urban and rural)
	Others
	Not used (0 for both urban and rural)

Rural degree of utilization

1. The percentage of piped sewer system in rural for 2008-09 and 2018 is considered zero based on expert opinion from Kerala Water Authority. The percentage of piped sewer system (rural) which is considered as zero is incorporated into 'others' and 'none' categories.
2. In order to get the percentage of septic tank for 2008-09 the corresponding proportions from NSS 2018 has been applied to septic tank/flush % of NSS 2008-09 data.
3. Others and none category constitute:

In NSS 2008-09: service latrine, others, not known

In NSS 2018: Others, Flush/pour-flush to twin leach pit/single pit, Flush/pour-flush to elsewhere, piped sewer system (only for rural).

Urban degree of utilization

1. In order to get the percentage of piped sewer system and septic tank for 2008-09 the corresponding proportions from NSS 2018 has been applied to septic tank/flush % of NSS 2008-09 data.
2. Others and none category constitute:

In NSS 2008-09: service latrine, others, not known

In NSS 2018: Others, Flush/pour-flush to twin leach pit/single pit, Flush/pour-flush to elsewhere, piped sewer system (only for rural).

2. Further Assessment of Degree of Utilization for 'Sewer' to account for Untreated Wastewater and Type of Treatment (Aerobic/Anaerobic):

Regarding the urban households that are served by the 'piped sewer system' category, it is necessary to further assess the proportion of wastewater discharged by this subset undergoing aerobic/anaerobic treatment or whether discharged without any treatment. This is because the quantum of CH₄ emission generated will vary for each of these discharge pathways, given that the corresponding MCF value is different for each pathway (see Table 78). Therefore, reported data on operational and non-operational capacity of sewage treatment, the treatment technologies used in STPs has been analyzed for the state and subsequently the fractions for degree of utilization for 'sewer systems' have been further split up into three pathways

- Sewer - collected and not treated
- Sewer - collected and anaerobic treatment
- Sewer - collected and aerobic treatment

State information related to STPs is not available for all the years from 2005-2021. Therefore, reported state information on STPs that is available for the four years from CPCB and Central Public Health and Environmental Engineering Organization (CPHEEO) of 1999, 2008, 2014 and 2020 has been used in the assessment. All the sewage treatment plants in Kerala are aerobic and well managed and hence, the 'sewer collected and not treated' percentage will be zero (expert opinion from Kerala Water Authority).

- 1999 STP data is used to find GHG emissions from Sewer until 2007
- 2008 STP data is used to find GHG emissions from Sewer until 2010
- 2014 STP data is used to find GHG emissions from Sewer from 2011 to 2015
- 2020 STP data is used to find GHG emissions from sewers from 2016 to 2023

The degree of utilization for the three sewer pathways – sewer (collected and not treated), sewer (collected and anaerobic treatment), and sewer (collected and aerobic treatment) considered in the emission estimates is as follows:

Table 82: Degree of Utilization for 'Sewer' to account for Untreated Wastewater and Type of Treatment (Aerobic/Anaerobic)

	1999	2008-09	2014-15	2020
Treatment type, Aerobic (%)	100%	100%	100%	100%
Treatment type, Anaerobic (%)	0.00%	0.00%	0.00%	0.00%
Sewer collected and not treated* (%)	0.00%	0.00%	0.00%	0.00%

4D2: Industrial Wastewater Treatment and Discharge

Category Description

CH₄ is emitted from industrial wastewater when it is treated or disposed of anaerobically. Wastewater from industrial sources may be treated on-site, transferred through a sewer to a centralized treatment plant or disposed off untreated in nearby areas or via an outfall³².

The scope of the GHG emissions estimation is limited to only those industry sectors which have substantial generation of wastewater containing organic matter, thereby leading to release of GHG emissions from treatment and/or discharge of such organic wastewater. Seven industry sectors have been included for estimating CH₄ from industrial wastewater based on a list of products identified in India's National Communications/ 2006 IPCC guidelines for National GHG inventories.³³ The product categories for the seven industry sectors included in the estimates are listed in the table below.

³² 2006 Intergovernmental Panel on Climate Change (IPCC) Guidelines for National Greenhouse Gas Inventories, Volume 5, Waste, Chapter 6

³³ This list was further refined based on GHGPI phase 4 methodology for the waste sector as well as inputs from the line departments concerned in Kerala.

Table 83: Industrial Sectors and products considered³⁴

Iron and steel	Production of Pig Iron, Sponge Iron and Finished steel (alloy & Non-alloy)
Meat	Finished Meat production from all the registered Slaughterhouses
Paper and Pulp	Production of paper from all pulp and paper industries
Petroleum	Refining and production of Petroleum, Oil and Lubricants
Rubber	Production of Finished Natural and Synthetic Rubber
Dairy	Production of milk in the Dairy Sector
Tannery	Production of Raw Bovine, Sheep, lamb, Goat and kid skins and hides
Fish processing	Preservation and processing of different types of fish in processing facilities

Assessment of CH₄ generation potential from industrial wastewater streams is based on the concentration of degradable organic matter in the wastewater, the volume of wastewater generated, and the type of prevalent wastewater treatment systems used by the respective industrial sector³⁵.

Methodology

The table 84 below details the sources of activity data used for estimating emissions from the Industrial Wastewater category. The production data (2019, 2020, 2023) used in estimating emissions from the industrial wastewater category are listed in table 85.

³⁴ Kolsepatil, N., Anandhan, S., Sekhar, A., Chaturvedula, S. (2019). Greenhouse Gases Emissions of India (subnational estimates): Waste Sector (2005-2015 series) dated September 25, 2019, Retrieved from: <http://www.ghgplatform-india.org/waste-sector>

³⁵ Kolsepatil, N., Anandhan, S., Sekhar, A., Chaturvedula, S. (2019). Greenhouse Gases Emissions of India (subnational estimates): Waste Sector (2005-2015 series) dated September 25, 2019, Retrieved from: <http://www.ghgplatform-india.org/waste-sector>

Table 84: Source of activity data³⁶ used for estimating emissions from Industrial Wastewater category

Category	Source of Production data	Effluent generation data
Petroleum	Petroleum Planning & Analysis Cell (PPAC) , Ministry of Petroleum & Natural Gas (2004-05 to 2008-09), Bharat Petroleum Kochi Refinery Performance, (2009-10 to 2021-22)	Dossier for sewage/ trade effluent generation/coastal discharge/STP/ETP details in the State of Kerala, KSPCB (As of 2020)
Diary	KSPCB	Annexure 2: Consented effluent generating and sewage & sullage generating units with their quantity.
Meat	KSPCB	
Fish Processing	KSPCB	
Paper and Pulp	KSPCB	
Tanney	KSPCB	
Rubber	GHGPI Phase III	NATCOM 2

Table 85: Activity data used in Industrial Wastewater category in 2019, 2020 and 2023

Category	Industry Production (Mt)		
	2019	2020	2023
Petroleum	15.45	13.34	15.29
Dairy	3.25	3.25	3.25
Meat	0.023	0.023	0.023
Fish processing	0.33	0.33	0.33
Paper and pulp	0.21	0.21	0.21
Tannery	0.005	0.005	0.005

³⁶ Activity data provided in financial year (FY) format was converted to calendar year (CY) format using the following equations:
CY Activity data = [$\frac{1}{4}$ *FY Activity Data_{Preceding year}] + [$\frac{3}{4}$ *FY Activity Data_{Succeeding year}]

Table 86: Type of Emission Factor and Level of Methodological Tiers adopted for Industrial Wastewater category

IPCC ID	GHG source and sink categories	CH ₄	
		Method Applied	Emission Factor
4A	Industrial wastewater Treatment and Discharge	T2	CS
T1: Tier 1; T2: Tier 2; CS: Country-specific; D: IPCC Default			

Equation Used

As per the 2006 IPCC Guidelines, the following equation is used to estimate CH₄ emissions from industrial wastewater treatment.

$$CH_4 \text{ Emissions} = \sum_i \left[\left(TOW_i - S_i \right) EF_i - R_i \right] \quad (IPCC \text{ 2006 Equation 6.4})$$

Where

TOW_i = state-wise total organically degradable material in wastewater from industry in inventory year, kg COD/yr

i = industrial sector

S_i = organic component removed as sludge in inventory year, kg COD/yr (Default value 0.35) (IPCC, 2006)

EF_i = emission factor for industry i, kg CH₄/kg COD for treatment/discharge pathway or system(s) used in inventory year

R_i = amount of CH₄ recovered in inventory year, kg CH₄/yr (0) (IPCC 2006)

$$TOW_i = P_i \bullet W_i \bullet COD_i \quad (IPCC \text{ 2006 Equation 6.6})$$

Where:

TOW_i = total organically degradable material in wastewater for industry i, kg COD/yr

i = industrial sector

P_i = state-wise total industrial product for industrial sector i, t/yr

W_i = wastewater generated, m³/t product

COD_i = chemical oxygen demand, kg COD/m³

Wastewater generated per tonne of product (Wi) from effluent generation data provided by KSPCB

- 1) Wastewater generated per tonne of product W_i (m^3 /tonne product)

$$= [(\text{Effluent generated per day} / 1000) / (\text{Industrial production per day})]$$
- 2) Effluent generated per day (litres/day)

$$= \text{Effluent generated given in million litres per day (MLD)} \times 10^6$$
- 3) Industrial production per day (tonnes/day) = Total industrial production for the year 2020 / 365

$$EF_j = B_o \cdot MCF_j \quad (\text{IPCC 2006 Equation 6.5})$$

Where,

EF_j = emission factor for each treatment/discharge pathway or system used by the industry, kg CH_4 /kg COD

j = each treatment/discharge pathway or system

B_o = maximum CH_4 producing capacity, kg CH_4 /kg COD (0.2594) (MoEFCC 2023)

MCF_j = methane correction factor (fraction)

The value of the MCF is based on the prevalent wastewater treatment system used in the respective industrial sector. The data sources to identify the prevalent wastewater treatment technologies for the industrial sectors are indicated in Table 87. State-level information for the emission factor related parameters is not available. Therefore, the national level values listed for each industry sector are used in the emission estimation for the state.

	MCF	0	GHGPI Phase III , ICLEI analysis of Sirajuddin, Ahmed, Umesh Chandra, R. K. Rathi, (2010) “Wastewater treatment technologies Commonly practiced in Major Steel Industries of India” In 16th Annual International Sustainable Development Research Conference 2010, 30 May – 1 June, 2010 The University of Hong Kong, Hong Kong.

Methane Recovery Rates

CH₄ is recovered in some of the industries such as dairy for energy purposes. In such cases, the methane recovered is to be subtracted from the total CH₄ estimated to be emitted from wastewater treatment in these industries. Since state-level information on methane recovery rates is not available, national-level values from NATCOM 2 have been used for the state³⁷.

Dairy: 75% methane recovery rate

Assumptions

- As per expert opinion from KPSCB, the installed capacity itself was taken as the average production quantity where average production data was not available.
- Except for petroleum, active years of production for the industrial units were not available. Hence the average production and effluent generated data provided by KSPCB was applied for the entire evaluation period (2005-2021).
- Wastewater generation per tonne of product would likely vary over the years, with improvements in production processes and technologies leading to a reduction in wastewater generation. However, due to the lack of such updated information, the constant values of wastewater generated per tonne of product have been used for all the years (2005-2021) in this assessment for the industry sectors. Wastewater generated per tonne of product (see table 88) is calculated using the 2020 production data in order to have the data almost in-sync with the effluent generated data in the most recent dossier released by Kerala State Pollution Control Board³⁸.
- State data on production of Petroleum is not available for 2004-05 to 2008-09. Reported data on the 'volume of crude oil processed' is available for different refineries along with their location for the period 2004-05 to 2008-09. National level data available on cumulative production of Petroleum products for 2004-05 to 2008-09 has been apportioned to the state based on the corresponding proportion of 'volume of crude oil processed' by each refinery to the 'total volume of Crude Oil processed' by all refineries³⁹.

THE DIRECTORATE OF ENVIRONMENT AND CLIMATE CHANGE (DoECC)

The Directorate of Environment and Climate Change (DoECC) under the Environment Department was constituted in December 2010. The Directorate is the nodal agency in the administrative structure of the Environment Department, responsible for planning, promoting, and coordinating the implementation of both Central and State level environmental protection and conservation policies and programs. The Directorate also serves as the nodal agency in formulating climate change-related policies, plans, programmes and their execution. The State Climate Change Cell (CCC) constituted vide G.O. (Rt) No. 27/2018/Envr dated 24-02-2018 in the Directorate coordinates all State-level programs concerning climate change.

VASUDHA FOUNDATION

Vasudha Foundation, a non-profit organization set up in 2010, is one of the prominent Think Tanks with the mission to conserve the environment through innovative approaches that can ensure a sustainable and inclusive future for India and Mother Earth with a mission to promote environment-friendly, socially just and sustainable models of energy by focusing on renewable energy and energy-efficient technologies and lifestyle solutions. Vasudha Foundation's approach is largely data-driven analysis, the creation of cross-sectoral data repositories along with strategic outreach to ensure resource conservation with the ultimate objective of conserving Mother Earth. Vasudha Foundation also works to limit global warming emissions by focusing on the highest emitting sectors like energy, transportation as well as industrial processes, the built environment and agriculture.

Vasudha Foundation has engaged actively with various organizations and agencies at both the national level and the State level and has forged many active partnerships. These include NITI Aayog at the national level, as well as with the Department of Environment, Forest and Climate Change, Government of Uttar Pradesh, Uttar Pradesh New and Renewable Energy Development Agency, Government of Uttar Pradesh, the Tamil Nadu Green Climate Company (TNGCC), Govt. of Tamil Nadu, Gujarat Energy Development Agency, Government of Gujarat and Department of Climate Change, Government of Gujarat, The Telangana State Renewable Energy Development Corporation Limited, Department of Finance, Government. of Odisha at the State level, to name a few.
